UNIVERSITY OF KERALA

POST GRADUATE PROGRAMMES IN CHEMISTRY

(Revised Syllabi under Semester System with effect from 2013 Admission)

PREAMBLE

The syllabi of M.Sc programmes in Chemistry offered in the affiliated colleges of the University under Semester system have been revised and the revised syllabi are to be effective from 2013 admission. There are three independent PG programmes in Chemistry, namely **M.Sc**. **Programme in Branch III - Chemistry**, **M.Sc. Programme in Branch IV - Analytical Chemistry and M.Sc. Programme in Branch V - Applied Chemistry**. All these three PG programmes are equivalent in all respect for employment and higher studies. Each of these three PG programmes shall extend over a period of two academic years comprising of four semesters, each of 450 hours in 18 weeks duration. The syllabi and scheme of examinations of these three programmes are detailed below. The theory courses of the first three Semesters and the practical courses of the first two semesters of the three programmes are common, and therefore, the examinations of these three PG programmes are to be conducted with common question papers for the first three semesters by a common Board of Examiners. These syllabi are effective from 2013 admission in affiliated colleges of the university.

M.Sc. PROGRAMME IN BRANCH III - CHEMISTRY

(Revised syllabus under semester system with effect from 2013 admission)

SYLLABUS AND SCHEME OF EXAMINATION

Course No. and Title	Hours per week		Duration of ESA in hours	Marks for CA	Marks for ESA	Total marks
	L	P				
SEMESTER I*						
CH 211 Inorganic Chemistry I	5		3	25	75	100
CH 212 Organic Chemistry I	5		3	25	75	100
CH 213 Physical Chemistry I	5		3	25	75	100
CH 214 Inorganic Practicals I		3	(To be continued in Semester II)			
CH 215 Organic Practicals I		3	(To be continued in Semester II)			
CH 216 Physical Practicals I		4	(To be continued in Semester II)			
			Total marks for semester 1			300
*Distribution of teaching hours/week: Theory- 15 hours, Practicals- 10 hours (1 hour for Seminar)						
SEMESTER II*						
CH 221 Inorganic Chemistry II	5		3	25	75	100
CH 222 Organic Chemistry II	5		3	25	75	100
CH 223 Physical Chemistry II	5		3	25	75	100
CH 214 Inorganic Practicals I		3	6	25	75	100
CH 215 Organic Practicals I		3	6	25	75	100
CH 216 Physical Practicals I		4	6	25	75	100
	Total marks for Semester II					600
*Distribution of teaching hours/week: Theory- 15 hours, Practicals- 10 hours (1 hour for Seminar)						

SEMESTER III*						
CH 231 Inorganic Chemistry III	5		3	25	75	100
CH 232 Organic Chemistry III	5		3	25	75	100
CH 233 Physical Chemistry III	5		3	25	75	100
CH 234 Inorganic Practicals II		3	(To be continued in Semester IV)			
CH 235 Organic Practicals II		3	(To be continued in Semester IV)			
CH 236 Physical Practicals II		4	(To be continued in Semester IV)			
			Total marks for semester III			300
*Distribution of teaching hours/week: Theory- 15 hours, Practicals- 10 hours (1 hour for Seminar)						
SEMESTER IV*						
CH 241(a) Advanced Inorganic Chemistry**						
CH 241(b) Advanced Organic Chemistry**	15		3	25	75	100
CH 241(c) Advanced Physical Chemistry**						
CH 234 Inorganic Practicals II		3	6	25	75	100
CH 235 Organic Practicals II		3	6	25	75	100
CH 236 Physical Practicals II		4	6	25	75	100
CH 242(a) Dissertation					90	90
CH 242(b) Visit to R & D Centre					10	10
Comprehensive viva-voce					100	100
	Total marks for Semester IV					600
	Grand total (for semesters I-IV)					1800
*****Distribution of teaching hours/week: Theory- 15 hours, 10 hours for discussion on project (1 hour for Seminar)						
**Each student has to choose either (a), (b), (c) as elective in accordance with the Dissertation chosen.						

M.Sc. PROGRAMME IN BRANCH III - CHEMISTRY

(Revised syllabus under Semester System w.e.f. 2013 Admission)

SEMESTER I

CH 211 INORGANIC CHEMISTRY - I

Total 90 h

Unit I Noble gases, halogens, isopoly and heteropoly acids 18 h

Noble gas compounds: Preparation, properties, structure and bonding. Halogens in positive oxidation states. Preparation, properties, structure, bonding and uses of inter halogen compounds, pseudo halogens, poly halide ions. Astatine: Synthesis, stability and properties.

Preparation, properties and structure of isopoly and heteropoly acids of Mo and W. Classification, preparation, properties and structure of borides, carbides, nitrides and silicides. Classification and structure of silicates. Properties and structure of aluminosilicates and zeolites. Preparation, properties and applications of silicones.

Unit II Coordination chemistry-I: Theories of metal complexes 18 h

Types of ligands and complexes. Isomerism: Geometrical, optical and structural isomerism. Stability of complex ions in aqueous solutions: Formation constants. Stepwise and overall formation constants. Factors affecting stability of complexes. Trends in stepwise constants. Determination of stability constants: spectrophotometric, polarographic and potentiometric methods. Stability of chelates. Thermodynamic explanation, macrocyclic effects.

Crystal field theory: Splitting of d orbitals in octahedral, tetragonal, square planar, tetrahedral, trigonal bipyramidal and square pyramidal fields. Jahn-Teller theorem, dynamic-static -evidence for JT effect. Crystal field stabilization energy (CFSE) and its calculations. Octahedral Site Stabilization Energy. Thermodynamic effects of CFSE. Factors affecting the splitting parameter. Spectrochemical series. Ligand field theory. Molecular orbital theory. Sigma and pi bondings in complexes. MO diagrams of octahedral complexes with and without pi bonds. Effect of pi bond on the stability of sigma bond. Nephelauxetic effect. Critical comparison of the three theories.

Unit III Analytical principles **18 h**

Evaluation of analytical data: Accuracy and precision. Standard deviation, variance and coefficient of variation. Student 't' test. Confidence limits. Estimation of detection limits. Errors: Classification, distribution, propagation, causes and minimization of errors. Significant figures and computation rules. Correlation analysis: Scatter diagram. Correlation coefficient, r. Calculation of r by the method of least squares.

Volumetric methods: Classification of reactions in volumetry. Theories of indicators. Acid-base, redox, adsorption, metallochromic, fluorescent and chemiluminescent indicators. Complexation titrations: Titration using EDTA. Precipitation titrations. Redox titrations. Gravimetric methods: Mechanism of precipitate formation. Aging of precipitates. Precipitation from homogeneous solutions. Coprecipitation and postprecipitation. Contamination of precipitates. Washing, drying and ignition of precipitates. Organic reagents used in gravimetry: Oxine, dimethylglyoxime and cupferron.

Unit IV Nanomaterials **18 h**

General introduction to nanomaterials and emergence of nanotechnology, Moore's law, synthesis and properties of fullerenes and carbon nanotubes, synthesis of nanoparticles of gold, silver, rhodium, palladium and platinum. Techniques of synthesis- electroplating and electrophoretic deposition, conversion through chemical reactions and lithography. Thin films- chemical vapour deposition and atomic layer deposition techniques.

Elementary idea of characterization of nanomaterials using XRD powder, TEM, AFM, SEM and STM techniques.

Diversity in nanosystems: self assembled monolayers on gold-growth process and phase transitions. Gas phase clusters- formation, detection and analysis. Quantum dots- preparation, characterization and applications.

Unit V Chemistry of natural environmental processes **18 h**.

The chemistry of processes in atmosphere: Composition of the atmosphere: Automobile pollutants and the catalytic converter. Photochemical smog. Chemistry of the stratosphere. Catalytic destruction of ozone. Depletion of the protective ozone layer. Effects of air pollutants on the human health.

The Chemistry of processes in hydrosphere: The hydrologic cycle. Cycling and purification. The unique properties of water. Acid base properties. CO_2 in water. Alkalinity. O_2 consuming waste.

The chemistry of processes in Lithosphere: Redox status in soil. pE pH predominance diagrams for redox sensitive elements. Acidity in soil materials.Acid neutralization capacity and the quantification of the soil acidity. Ion speciation in soil solution. Quantitative aspects of ion speciation. Cation exchange capacity and exchange phase composition.

CH 212 ORGANIC CHEMISTRY - I

Total 90 h

Unit I Stereochemistry of organic compounds 18 h

Nomenclature of organic compounds, Fused polycyclic hydrocarbons, Bridged polycyclic hydrocarbons, Bridged fused systems, Spirocyclic hydrocarbon systems, Heterocyclic systems,Metal organic compounds.

Molecular chirality, stereochemical nomenclature, prostereoisomerism, stereotopicity and stereoprojections. Non-carbon chiral centres. Introduction to ORD, CD configuration and their application in assigning configuration and conformation. Octant and axial haloketone rules. Cotton effect. Stereochemistry of nitrogen and phosphorus containing compounds. Atropisomerism and its designation. Stereoselectivity, enantiomeric excess and chiral separation methods. Conformational analysis of alkanes, cycloalkanes and biased systems. Effect of conformation on reactivity of cyclohexane and decalin derivatives. Chiral drugs.

Unit II Structure, reactivity and intermediates 18 h

Electronic and steric effects. Influence of structural features on acidity, basicity and reactivity of organic compounds. Structure, formation and properties of carbens, nitrenes and arynes. Singlet and triplet carbenes, formation and reactions. Carbon radicals: Structure, formation and stability. Radical reactions, autoxidation and radical chain reactions. Structure, stability and formation of carbocations, carbanions. Arynes: Formation and structure. S_N1, S_NAr, benzyne and $S_{NR}1$ mechanism in aromatic nucleophilic substitution.Orientation effects of substituents in aromatic electrophilic substitutions.

Unit III. Substitution and elimination reactions 18 h

Nucleophilic susbstitution at sp^3carbon, its mechanisms and stereochemical aspects. Effect of solvent, leaving group and substrate structure. S_N^1 , S_N^2, S_N1^1, S_N2^1, S_Ni reactions. Neighbouring group participation. Non-classical carbocations. Elimination reactions leading to C=C ond formation and their mechanisms. E1, E2 and E1CB mechanisms. Stereoaspects of C=C bond formation. Effect of leaving group and substrate structure. Hoffmann and Saytzeff elimination. Cis elimination. Competition between S_N^1 and S_N^2 , E1and E2, Alkyl halides as survival compounds

Unit IV Reactivity of unsaturated systems 18 h

Stereoaspects of the addition of X_2, HX, boranes and hydroxylation to C=C systems**.** Effect of substituents on the rate of additions. Cis and trans hydroxylation of cycloalkenes. Nucleophilic addition to activated C=C systems. Michael addition. Mechanism, with evidence of Aldol (normal, crossed and directed), Perkin, Stobbe, Knovenagel, Darzen, Reformatsky and benzoin condensations. Grignard, Cannizaro, Wittig and Wittig-Horner reactions. Mechanism and stereochemistry of addition to C=O systems. Cram's rule, Felkin-Anh model, Mechanism of esterification and ester hydrolysis. Structure of the transition state in the addition reactions.

Unit V Separation techniques 18 h

Classification of chromatographic methods. Theory of chromatography. Applications of chromatographic methods. Adsorption and partition chromatography. Paper, thin layer and column chromatographic methods. Centrifugal TLC, LC, Pressure column chromatography, HPLC and GC. Column matrices. Detectors. Affinity and chiral separations using HPLC. Normal and ultra centrifugation. Gel and Capillary electrophoresis and their applications. Solvent extraction. Extraction using supercritical liquid CO_2, Craig's technique of iquid liquid extraction.

CH 213-PHYSICAL CHEMISTRY -I

Total 90 h

Unit I Quantum mechanics 18 h

Experimental foundation of quantum mechanics- The black body radiation, Compton effect, photoelectric effect, atomic spectra. Failure of classical mechanics, need of quantum mechanics. Concept of matter wave, de Broglie relation and its experimental proof, Uncertainty principle and its consequences.

The postulates of quantum mechanics: Wave function postulate- wave function and its physical meaning, well behaved functions, boundary conditions, orthogonality and orthonormality. Operator postulate- Laplacian and linear operators. Angular momentum operators and commutators. Hamiltonian operator and its properties. Eigen value postulate- eigen value equations and eigen functions. Expectation value postulate. Postulate of time-dependent Shrodinger equation.

Application to simple systems: Solution of Schrodinger wave equation for a free particle, particle on a ring, particle in 1D box, particle in 3D box, separation of variables, degeneracy.

One dimensional Harmonic oscillator- Complete solution. Hermite polynomials, recursion formula, features of the wave functions.

Hydrogen like systems- wave equation in polar coordinate. Separation of variables. R, theta and phi equations. Solution of phi equation. Wave functions of hydrogen like systems. Orbital and radial functions. Radial distribution functions, angular functions and their plots.

Stern-Gerlach experiment. The postulate of spin. Spin orbitals. Many electron atoms. Qualitative idea of self consistant field method. The exclusion principle. Vector atom model. Spin-orbit coupling. Term symbols and explanation of spectral lines.

Unit II Molecular symmetry **18 h**

Symmetry and Character table: Symmetry elements and symmetry operation. Matrix representation of symmetry operations. Character of a matrix. Conditions for a set of elements to form a group. Point groups. Multiplication of operations. Group multiplication table. Similarity transformation and classification of symmetry operation, Matrix representation of point group. Reducible and Irreducible representations. The Great Orthogonality theorem. Rules derived from GOT (proof not required). Setting up of character table of C_{2v}, C_{3v} and C_{2h} groups. Direct product representations.

Reduction formula, reduction of reducible representation to IRs. Transformation properties of atomic orbitals. Hybridisation: identification of atomic orbitals taking part in hybridisation of triangular planar, square planar, triagonal bipyramidal, square pyramidal and tetrahedral molecules. Molecular symmetry and optical activity.

Unit III Basics of chemical thermodynamics . 18 h

First and second laws of Thermodynamics. Concept of entropy, Free energy. Criteria of Spontaneity and equilibrium. Fundamental equations for open system. Euler's relation. Maxwell relations. Thermodynamic equations of state. Third law of Thermodynamics. Apparent exceptions to the third law. Applications of third law.

Properties of mixtures: Thermodynamics of ideal and non ideal solutions. Partial molar quantities, Chemical potential. Duhem- Margules equation. , Konowaloff's law, Excess thermodynamic functions. Determination of Partial molar properties.

Fugacity and Activity: Fugacity of gases, its determination. Variation of Fugacity with temperature and Pressure. Fugacity of liquids and solids. Fugacity of mixtures of gases. Lewis Randall rule. Fugacity in liquid mixtures. Activity and Activity coefficients. Determination of activity and activity coefficients of electrolytes and non electrolytes.

Reaction Isotherm and spontaneity of reaction. Variation of Equilibrium constant with temperature and pressure. Variation of standard free energy with temperature. Simultaneous equillibria and addition of free energies. Standard free energy of formation and its determination, Free energy functions.

Unit IV Chemical kinetics 18 h

Complex reactions, Reversible, Consecutive, Concurrent and branching reactions. Free radical and chain reactions. Steady state treatment. Reactions like H_2-Cl_2, H_2-Br_2, and decompositions of ethane , acetaldehyde and N_2O_5. Rice-Herzfeld mechanism, Potential energy surfaces-adiabatic and non adiabatic curve crossing processes. Unimolecular reaction. Lindemann treatment. Semenoff-Hinshelwood mechanism of chain reactions and explosion.

Kinetics of fast reactions: Relaxation method, relaxation spectrometry, flow method, shock method, fast mixing method, field jump method, pulse method Flash photolysis and NMR method.

Theories of Reaction rate : Arrhenius equation and its limitations, activation energy , Collision theory and absolute reaction rate theory. Free energy of activation and volume of activation. Thermodynamic formulation of reaction rate. Effects of pressure and volume on the velocity of gas reaction.

Reactions in solution: Comparison between reactions in gas phase and in solution. Factors determining reaction rates in solution. Reaction between ions and influence of ionic strength. Primary and secondary kinetic salt effects. Influence of solvent on reaction rate. Significance of volume of activation. Hammet and Taft equation.

Photochemistry: Effect of radiation on the rate of reaction. Laws of photochemistry. Quantum yield. Photo chemical reactions of H_2-Cl_2, H_2-Br_2.

Unit V Gases, liquids and liquid crystals 18 h

Random movement of molecules: Brownian movement and determination of Avogadro number. The distribution of molecular velocities. Derivation and discussion on Maxwell's equation. Derivation of average and most probable velocities from Maxwell's equation. Influence of temperature on molecular velocities . Molecular collision and mean free path. Homogenous and heterogeneous collisions. Collision of molecules with surface and effusion. Effect of molecular interactions on collision. Transport properties: Viscosity, thermal conductivity and diffusion. Determination of viscosity of gases. Influence of temperature and pressure on transport properties.

Liquid state: X-ray diffraction study of simple liquids and their structure. Oscillator theory of liquid state. Specific heat of liquids.

Liquid crystals: Mesomorphic state, types, examples and applications of liquid crystals. Theory of liquid crystals.

CH 214 INORGANIC CHEMISTRY PRACTICALS -1

Total 125 h

1. Separation and identification of rare/less familiar cations such as Ti, W, Mo, Th, Zr, V, U and Li
2. Volumetric estimation using EDTA, ammonium vanadate, ceric sulphate etc.
3. Colorimetric/spectrophotomteric estimation of Cr, Fe, Mn, Ni, Cu etc.
4. Preparation of metal complexes: selection can be made from the following or any other from the existing literature.

   i) $[Co(NH_3)_6]Cl_3$, (ii). $[Cu(NH_3)4]SO_4$ (iii) $K_3[Cr(C_2O_4)_3]$

   iv). $K_3[Fe(C_2O_4)_3]$, v). Cis and trans isomers of $[Co(en)_2Cl_2]Cl$

   iv). $[Cr(en)_3]Cl_3$

CH 215 ORGANIC PRACTICALS-1

Total 125 h

A . Separation and identification of organic compounds

1. Quantitative wet chemistry separation of a mixture of two components by solvent extraction

2. Purification of the separated samples by boiling and crystallization.

3. TLC of the purified samples along with the mixture in same TLC plates (if not possible use separate plates) and calculation of R_f values.

B. Separation of a mixture of by column chromatography

1) Malachite green and methylene blue 2) O-nitroaniline and p-nitroaniline.

C. Preparation of compounds by two stages.

TLC analysis of the products and original compound in the same plate and measurement of Rf values. Recording UV, IR, NMR and mass spectrum of synthesized compounds.

1) Acetanilide- ⟶ p-nitroacetanilide ⟶ p-nitroaniline

2) Methylbenzoate ⟶ m-nitromethylbenzoate ⟶ m-nitrobenzoic acid

3) Acetanilide- ⟶ p-bromoacetanilide ⟶ p-bromooaniline

E. Green Organic Chemistry experiments

1) Acetanilide- ⟶ p-bromoacetanilide (KBr and CAN)

2) Benzophenone ⟶ Benzopinacol (photoreduction)

CH 216 PHYSICAL PRACTICALS –I

Total 125 h

1. Adsorption

Freundlich and Langmuir isotherms for adsorption of acetic/oxalic acid on active charcoal.

Determination of concentration of acetic/ oxalic acid.

2. Kinetics

Determination of rate constant of acid hydrolysis of methyl acetate.

Determination of Arrhenius parameters.

Determination of concentration of given acid.

Determination of rate constant of the saponification of ethyl acetate and evaluation of Arrhenius parameters.

Determination of rate constant of reaction between $K_2S_2O_8$ and KI.

Study the kinetics of iodination of acetone in acid medium.

3. Phase rule

Solid-liquid equilibria – Construction of phase diagram and determination of the composition of unknown mixture (naphthalene/biphenyl, naphthalene/benzophenone, naphthalene/diphenyl amine)

Construction of phase diagram with congruent melting point- naphthalene/meta-dinitrobenzene

Partially miscible liquid pairs- CST of phenol-water system.

Effect of impurities (KCl/ NaCl/ succinic acid) on the miscibility temperature of phenol-water system and hence the concentration of given unknown solution.

Three component system- Construction of ternary phase diagram of acetic acid-chloroform-water system and hence the composition of given homogeneous mixture.

Construction of tie-line.

4. Distribution law

Distribution coefficient of iodine between CCl_4 and water

Distribution coefficient of benzoic acid between toluene and water.

Determination of the equilibrium constant of the reaction $KI+I_2 \rightarrow [KI_3]$ and hence the concentration of given KI.

Distribution coefficient of ammonia between chloroform and water.

Determination of equilibrium constant of copper- ammonia complex by partition method or coordination number of Cu^{2+} in copper-ammonia complex.

Determination of hydrolysis constant of anilinium hydrochloride.

5. Dilute solutions

Determination of K_f of solid solvent, molar mass of non-volatile solute, mass of solvent and composition of given solution (Solvent- Naphthalene/Biphenyl/ Benzophenone etc. Solute- Naphthalene/ Biphenyl/ Diphenylanmine etc)

Determination of vant Hoff's factor for benzoic acid in Naphthalene.

Determination of atomicity of sulphur.

6. Transition temperature

Determination of K_T of salt hydrate, molar mass of solute, mass of salt hydrate and composition of given solution (Solvent- $Na_2S_2O_3.5H_2O/CH_3COONa.3H_2O$, Solutes- glucose, sucrose, urea)

7. Thermochemistry

Determination of the concentration of given strong acid/alkali.

Thermometric titration of NaOH Vs standard HCl.

Heat of displacement of Cu^{2+} by Zn.

Determination of the heat of ionisation of acetic acid.

SEMESTER II

CH 221 INORGANIC CHEMISTRY –II

Total 90 h

Unit I Sulphur, nitrogen, phosphorus and boron compounds 18 h

Sulphur-nitrogen compounds: Tetrasulphur tetranitride, disulphur dinitride and polythiazyl S_xN_y compounds. S-N cations and anions. Other S-N compounds. Sulphur-posphorous compounds:

Molecular sulphides such as P_4S_3 , P_4S_7 , P_4S_9 and P_4S_{10} . Phophorous-nitrogen compounds: Phosphazines. Cylco and linear phosphazines. Other P-N compounds

Boron-nitrogen compounds: Borazine, substituted borazines and boron nitride. Boron hydrides: Reactions of diborane. Structure and bonding. Polyhedral boranes: Preparation, properties, structure and bonding. The topological approach to boron hydride structure. *Sytx* numbers. Importance of icosahedral framework of boron atoms in boron chemistry. Closo, nido and arachno structures. Structural study by NMR. Wade's rules. Carboranes. Metallocarboranes. Organoboron compounds and hydroboration.

Unit II Coordination chemistry-II: Spectral and magnetic properties of transition metal complexes 18 h

Electronic spectra of metal complexes- Term symbols of d^n system, Racah parameters, splitting of terms in octahedral and tetrahedral fields. Correlation diagrams for d^n and d^{10-n} ions in octahedral and tetrahedral fields (qualitative approach), *d-d* transition, selection rules for electronic transition-effect of spin orbit coupling and vibronic coupling

Interpretation of electronic spectra of complexes- Orgel diagrams, Tanabe-Sugano diagrams, Calculation of Dq , B and β (Nephelauxetic ratio) values, charge transfer spectra.

Magnetic properties of complexes-paramagnetic and diamagnetic complexes, molar susceptibility, Gouy's method for the determination of magnetic moment of complexes, spin only magnetic moment. Temperature dependence of magnetism. Temperature Independent Paramagnetism (TIP). Spin state crossover, Antiferromagnetism-inter and intra molecular interaction. Application of magnetic measurements in the determination of structure of transition metal complexes.

Unit III Crystalline state 18 h

Crystal systems and lattice types. Bravais lattices. Crystal symmetry. Introduction to point groups and space groups. Miller indices. Reciprocal lattice concept. Close packed structures: BCC, FCC and HCP . Voids. Coordination number. Crystal binding: Molecular, covalent, metallic and hydrogen bonded crystals. X- Ray diffraction by crystals: Function of crystals. Transmission grating and reflection grating. Braggs equation. Diffraction methods: Powder, rotating crystal, oscillation and Weisenberg methods. Indexing and determination of lattice type and unit cell dimensions of cubic crystals.

Crystal defects: Perfect and imperfect crystals. Point, line and plane defects. Thermodynamics of Schottky and Frenkel defects. Colour centers in alkali halide crystals. Defect clusters. Extended defects: Crystallographic shear structure and stacking faults. Dislocations and crystal structure. Structure of compounds of AX (Zinc blende, Wurtzite) , AX_2 (Rutile, fluorite, antifluorite), A_mX_2 (Nickel arsenide), ABX_3 (Perosvskite, Ilmenite). Spinels. Inverse spinel structures.

Unit IV Lanthanides and actinides 18 h

Lanthanides: Characteristic properties. Electronic configurations and term symbols. Occurrence and extraction. Separation techniques. Oxidation states. Spectral and magnetic properties. Shapes of f orbital and their splitting in cubic ligand field. Actinides: Occurrence and general properties. Extraction of thorium and uranium. Electronic configuration and term symbol. Oxidation states. Spectral and magnetic properties. Comparative properties of lanthanides and actinides. Trans-uranium elements and their stabilities. Applications of lanthanide and actinide compounds. Comprehensive study of the beach sands of Kerala and their important components such as monazite, ilmenite, zircon and silminite.

Unit V Solid state chemistry 18 h

Electronic structure of solids. Free electron theory, band theory. Refinements to simple band theory, k space and Brillouin zones. Conductors, insulators and semiconductors. Band structure of conductors, insulators and semiconductors and their applications. Colour in inorganic solids.

Intrinsic and extrinsic semiconductors, doping of semiconductors and conduction mechanism, the band gap, temperature dependence of conductivity, carrier density and carrier mobility in semiconductors, synthesis and purification of semiconducting materials, single crystal growth, zone refining, fractional crystallization, semiconductor devices, rectifier transistors, optical devices, photoconductors, photovoltaic cells, solar batteries.

CH 222 ORGANIC CHEMISTRY- 11

Total 90 h

Unit I Molecular rearrangement and transformation reactions 18 h

Types of organic rearrangements. Anionic, cationotropic, prototropic, free radical, carbene, nitrene and long-range rearrangements. Mechanism with evidence of Wagner-Meerwein, Pinacol, Demjanov, Hofmann, Curtius, Schmidt, Lossen, Beckmann, Wolf, Fries, Arylazo, Fischer-Hepp, Hofmann-Martius, Von-Richter, Orton, Bamberger, Smiles, Dienone-phenol, Benzilic acid, Benzidine, Favorskii, Stevens, Wittig, Sommelet-Hauser, Bayer-Villiger, Hydroperoxide and borane rearrangements.

Unit II Aromaticity and symmetry controlled reactions 18 h

Aromaticity and antiaromaticity. Homo, hetero and non benzenoid aromatic systems. Aromaticity of annulenes, mesoionic compounds, metallocenes, cyclic carbocations, carbanions and fullerenes. Symmetry properties of MOs. Classification of pericyclic reactions. Mechanism and stereochemistry of electrocyclic, cycloaddition and sigmatropic reactions. Woodward- Hoffmann rules. FO, CD and Huckel-Mobius analysis of electrocyclic and cycloaddition reactions including biological cyclo additions. FO analysis of [I, j] and [3, 3] migrations. 1, 3- dipolar cycloaddition. Stereo aspects of Diels- Alder reaction and Cope re arrangement. Fluxinol molecules. Retro Diels- Alder, ene, cheletropic and cis elimination reactions and synthetic applications.

Unit III Organic photochemistry 18 h

Photochemical processes**.** Energy transfer, sensitization and quenching. Singlet and triplet states and their reactivity. Photoreactions of carbonyl compounds, enes, dienes and arenes. Norrish reactions of acyclic ketones. Free radical reactions. Patterno-Buchi, Barton, photo-Fries and Di-л methane rearrangements. Photoreactions of Vitamin D. Photosynthesis and photochemistry of vision. Singlet oxygen generation and their reactions. Applications of photochemistry.

Unit IV Chemistry of natural products and biomolecules 18 h

Introduction to primary and secondary metabolites in plants. Extraction methods of chemical constituents from plants, such as fractionation using solvents, specific extraction of alkaloids and supercritical fluid extraction. Characterizations of isolated compounds (terpenes, sterols, alkaloids, carbohydrates, flavonoids and poly phenols) by colour reactions and spray reagents. Biosynthesis of terpenes from mevalonic acid and sterols from squalene. Structure elucidation of ocimene monoterpene, classification of pigments, structure elucidation of β –carotene. Structural differences between a triterpene and a sterol. Synthesis of quercetin, synthesis of testosterone, androsterone, estrone and progesterone. Determination of carbon skeleton of alkaloids (Hofmann, Emde and Von Braun degradation methods). Structural elucidation of ephedrine, nicotine , atropine,hygrine.

Unit V Physical organic chemistry 18 h

Reactivity in relation to molecular structure and conformation. Steric effects. F strain. Ortho effect. Bond angle strain. The Hammett equation and its applications. Taft equation. Linear free energy relationships. Solvent polarity and parameters. Y, Z and E parameters and their applications. Primary and secondary kinetic isotope effects. Salt effects and special salt effects in SN reactions. Kinetic and thermodynamic control of reactions. The Hammond postulate. Principle of microscopic reversibility. Marcus theory. Methods of determining reaction mechanisms. Phase transfer catalysis and its applications.

CH 223 PHYSICAL CHEMISTRY -II

Total 90 h

Unit I Chemical Bonding 18 h

Approximate methods: Variation method- Variation theorem and its proof. Linear variation functions. Secular equations and secular determinants.

Perturbation method-Successive correction to an unperturbed problem. Detailed treatment of first order non-degenerate case only. LCAO-MO Theory- MO theory of H_2^+ and H_2. MO treatment of other homo diatomic molecules Li_2, Be_2, B_2, C_2, N_2, O_2 and F_2. MO treatment of hetero diatomic molecules LiH, CO, NO and HF. Spectroscopic term symbols for homo diatomic molecules.

Valance bond theory of H_2. Quantum mechanical treatment of SP, SP^2 and SP^3 Hybridisation.

HMO theory of conjugated π-systems. Bond order and charge density calculations. Free valance. Application of HMO method to ethylene, allyl system, butadiene and benzene.

Secondary bond forces: ion dipole, dipole-dipole, ion-induced dipole, London dispersion forces.

Unit II Spectroscopy –I 18 h

Microwave spectroscopy: Rotational spectrum, Intensity of spectral lines, calculation of inter nuclear distance. Non-rigid rotors and centrifugal distortion. Rotational spectra of polyatomic molecules-linear and symmetric top molecules. Introduction to instrumentation.

Vibrational Spectroscopy: Vibrational spectra of harmonic and anharmonic oscillator. Selection rules. Morse curve, fundamentals and overtones. Determination of force constant. Rotational fine structure, P,Q,R branches of spectra.

Vibrational spectra of polyatomic molecules: Normal modes, classification of vibrational modes into stretching (asymmetric, symmetric), bending, parallel and perpendicular vibrations. Finger print region and group frequencies. Introduction to FTIR and instrumentation.

Raman spectroscopy: Raman scattering, polarisability and classical theory of Raman spectrum. Rotational and vibrational Raman spectrum. Raman spectra of polyatomic molecules. Complementarity of IR and Raman spectra. Mutual exclusion principle. Introduction to instrumentation. Laser Raman spectrum.

Electronic spectra. Electronic spectra of diatomic molecules. Vibrational coarse structure and rotational fine structure of electronic spectrum. Franck-Condon principle. Types of electronic transitions. Fotrat diagram. Predissociation . Calculation of heat of dissociation.

Electronic spectra of polyatomic molecules: Electronic transition among molecular orbitals and absorption frequencies. Effect of conjugation. Introduction to instrumentation. Simultaneous determination of two components.

Unit III Applications of thermodynamics 18 h

Phase equillibria: Criteria of Equillibrium. Derivation of phase rule Discussion of two component systems forming solid solutions with and without maximum or minimum in freezing point curve. Systems with partially miscible solid phases.

Three component systems : Graphical representation. Three component liquid systems with one pair of partially miscible liquids. Influence of temperature. Systems with two pairs and three pairs of partially miscible liquids. Two salts and water systems. Isothermal evaporation. Transition point and double salt formation.

Thermodynamics of irreversible processes : Simple examples of irreversible processes. General theory of non equilibrium processes. Entropy production from heat flow. Matter flow and current flow. Generalised equation for entropy production. The phenomenological relations. Onsager reciprocal relation, Application of irreversible thermodynamics to diffusion. Thermal diffusion, Thermo osmosis and thermomolecular pressure difference., electro kinetic effects, the Glansdorf- Pregogin equation. Far from equilibrium region. Principle of minimum entropy production. Thermodynamic analysis of stability. Stability criterion and Le-Chatelier Brawn Principle.

Unit IV Statistical mechanics –I 18 h

Mechanical description of molecular systems. Thermodynamic probability and entropy. Microstates. Concept of ensembles Canonical and Grand canonical ensemble. Maxwell Boltzmann distribution.

Quantum statistics: Bose Einstein Statistics , Bose Einstein distribution. Thermodynamic probability, Bose Einstein distribution function. Examples of particles. Theory of Para magnetism. Bose Einstein condensation, Liquid Helium. Supercooled liquid. Fermi- Dirac Statistics. Fermi- Dirac Distribution, Examples of particles Fermi Dirac Distribution function Thermionic emission. Relation between Maxwell Boltzmann, Bose Einstein and Fermi - Dirac Statistics

The Partition functions. Partition function for free linear motion, for free motion in a shared space, for linear harmonic vibration.

Unit V Electrochemistry 18 h

Ionics- Ions in solution. Deviation from ideal behaviour. Ionic activity. Ion-solvent interaction. Born equation. Ion-ion interaction. Activity coefficient and its determination. Debye-Huckel limiting law. Equation for appreciable concentration. Osmotic coefficient. Activities in concentrated solutions. Ion associations. Strong electrolytes. Ion transport. Debye-Huckel treatment. Onsager equation. Limitation of the model. Conductance at high frequencies and high potentials.

Electrodics: Different type of electrodes. Electrochemical cells. Concentration cells and activity coefficient determination. Origin of electrode potential. Liquid junction potential. Evaluation of thermodynamic properties. The electrode double layer. Electrode-electrode interface. Theory of multilayer capacity. Electrocapillarity. Lippmann potential and membrane potential.

Fuel cells- H_2-O_2 fuel cell, fuel cell for high temperature applications.

Electrokinetic phenomena. Mechanism of charge transfer at electrode- electrolyte interface. Electrolysis. Current- potential curve. Dissolution, deposition and decomposition potentials. Energy barriers at metal –electrolyte interface. Different types of overpotentials. Butler-Volmer equation. Tafel and Nernst equation. Rate determining step in electrode kinetics. The hydrogen and oxygen over voltage. Theories of overvoltage.

SEMESTER III

CH 231 INORGANIC CHEMISTRY- III

Total 90 h

Unit I Organometallic compounds 18 h

Nomenclature of organometallic compounds.Types of metal complexes. Metal carbonyls, bonding in metal carbonyls. Application of infrared spectroscopy for the elucidation of metal carbonyl bonding. Bonding in metal nitrosyls and cyanides. Synthesis, structure and bonding in polynuclear carbonyls with and without bridging. Complexes with linear π- donor ligands: Olefins, acetylenes, dienes and allyl complexes. Hapto nomenclature. Complexes with cyclic π donors: Cyclopentadiene, benzene, cycloheptatriene and cyclooctatetraene complexes, structure and bonding. Fluxional molecules. Catalysis by organometallic compounds: Hydrogenation, hydroformylation and polymerization reactions.

Unit II Coordination chemistry-III: Reactions of metal complexes 18 h

Energy profile of a reaction - Thermodynamic and kinetic stability, Classification of ligand substitution reactions -kinetics and mechanism of ligand substitution reactions in square planar complexes, trans effect- theory and synthetic applications.

Kinetics and mechanism of octahedral substitution- water exchange, dissociative and associative mechanisms, base hydrolysis, racemization reactions, solvolytic reactions (acidic and basic)

Electron transfer reactions: Outer sphere mechanism- Marcus theory, inner sphere mechanism- Taube mechanism. Photochemical reactions- substitution and redox reactions of Cr(III) , Ru(II) , and Ru(III) complexes. Photo-isomerisation and photo-aquation reactions of metal complexes.

Unit III Bioinorganic chemistry 18 h

Essential and trace elements in biological systems, structure and functions of biological membranes, mechanism of ion transport across membranes, sodium-potassium pump. Photosynthesis, porphyrin ring system, chlorophyll, PS I and PS II. Synthetic model for photosynthesis. Role of calcium in biological systems.

Oxygen carriers and oxygen transport proteins- haemoglobin, myoglobin and haemocyanin. Iron storage and transport in biological systems- ferritin and transferrin. Redox metalloenzymes-cytochromes, peroxidases and superoxide dismutase and catalases. Nonredox metalloenzymes- CarboxypeptidaseA- structure and functions. Nitroeenaesesgeases, biological nitrogen fixation. Vitamin B_{12} and coenzymes.

Unit IV Electrical and magnetic properties of solids 18 h

Conductivity of pure metals. Superconductivity. Photoconductivity. Photovoltaic effect, Dielectric properties. Dielectric materials. Ferroelectricity, pyroelectricity, piezoelectricity and ionic conductivity. Applications of ferro, piezo and pyroelectrics.

Magnetic properties of solids: Behaviour of substances in a magnetic field. Diamagnetism, paramagnetism, ferromagnetism, antiferromagnetism and ferrimagnetism. Effect of temperature, Curie and Curie- Weiss laws. Magnetism of ferro and antiferromagnetic ordering. Super exchange. Lasers and their applications.

Unit V Nuclear chemistry 18 h

Nuclear structure, mass and charge. Nuclear moments. Binding energy. Semiempirical mass equation. Stability rules. Magic numbers. Nuclear models: Shell, Liquid drop, Fermi gas, collective and optical models. Equation of radioactive decay and growth. Half life and average life. Radioactive equilibrium. Transient and secular equilibria. Nuclear reactions. Introduction, production of projectiles, nuclear reaction cross section, nuclear dynamics, threshold energy of nuclear reaction, Coulomb scattering, potential barrier, potential well, formation of a compound nucleus. Nuclear reactions: Direct nuclear reactions, heavy ion induced nuclear reactions, photonuclear reactions.

Neutron capture cross section and critical size. Nuclear fission as a source of energy, Nuclear chain reacting systems. Principle of working of the reactors of nuclear power plants. Breeder reactor. Nuclear fusion reaction, stellar energy. Detection and measurement of radiation.

CH 232 ORGANIC CHEMISTRY-111

Total 90 h

Unit 1 UV-VIS, IR and Mass spectroscopy 18 h

Electronic transitions and analysis of UV spectra of enes, enones and arenes. Woodward-Fieser rules. Effect of solvent polarity on UV absorption. Principle of characteristic group frequency in IR. Identification of functional groups and other structural features by IR, Hydrogen bonding and IR bands. Sampling techniques. FTIR and its

instrumentation. Organic mass spectroscopy. EI, CI, FAB, Electrospray and MALDI ion sources. Magnetic, High resolution (Double focusing), TOF and quadruple mass analysers. Characteristic EIMS fragmentation modes and MS rearrangements. Mass spectral fragmentation patterns of long chain alkanes, alkenes, alkynes, carbonyl , nitro, amino and carboxy compounds. Strategies for the analysis of mass spectra..

Unit II NMR Spectroscopy and structure elucidation 18 h

Theory of NMR spectroscopy, chemical shifts, anisotropic effects and coupling constant. Spin-spin interactions in typical systems. First order and second order spectra. Simplification methods of complex spectra by high field NMR, shift reagents, chemical exchange and doule resonance. Theories of FT NMR (1D NMR), 2D NMR and ^{13}C NMR spectroscopies. ^{13}C NMR chemical shifts. Instrumentation of NMR. Applications of NOE, APT, DEPT, INEPT and 2-DNMR and INADEQUATE, HOHA spectroscopies. Introduction to 3D NMR. Spectral interpretations and structure identification. Spectral interpretation using actual spectra taken from standard texts. Solving of structural problems on the basis of numerical and spectrum based data.

Unit III Molecular recognition and supramolecular chemistry 18 h

Introduction to supramolecular chemistry. One-pot reactions.The concepts of molecular recognition, host, guest and receptor systems. Forces involved in molecular recognition. Hydrogen bonding, ionic bonding, π-stacking, Vander Walls and hydrophobic interactions. Introduction to molecular receptors. Tweezers, cryptands and carcerands. Cycophanes, cyclodextrins and calixarenes- typical examples. Non-covalent interactions in biopolymer structure organization. Role of self organization and self association in living nature. Importance of molecular recognition in DNA and protein structure, their function and protein biosynthesis. Supramolecular systems like Organic zeolite, Clathrate hydrates of gases, Helicates. Nanotubes, liquid crystals, nanotechnology and other industrial applications of supramolecular chemistry.

Unit IV Medicinal chemistry 18 h

Retrosynthetic analysis and disconnection approach. Synthetic strategy and synthons **,**

Combinatorial organic synthesis, introduction, methodology, automation, solid supported and solution phase synthesis, study of targeted or focused libraries and small molecule libraries, Applicaion- drug discovery.

Drug design and development-Discovery of a drug, a lead compound. Development of drug-Pharmaccophore identification, modification of structure, structure-activity relationship, structure modification to increase potency. The Hammet equation, Taft equation and lipophilicity. Computer assisted drug design. Receptors and drug action. Natural products and drug development. Different classes of drugs with examples. Synthesis of paracetamol, phenobarbital, diazepam, sulphamethoxazole, benzyl penicillin, chloramphenicol.

Unit V Green chemistry 18 h

Twelve principles of green chemistry. Green chemical strategies for sustainable development- Reaction mass balance, atom economy evaluation for chemical reaction efficiency, green solvents, reaction media- Synthesis under water, solventless, fluorous and ionic liquid media. Synthesis using scavenger resins, catalysis and biocatalysis. Green computation. Green processes-. Microwave synthesis- fundamentals of microwave synthesis-Two Principal Mechanisms for Interaction With Matter- The Microwave Effect with examples - Single-Mode and Multimode Microwave cavities. Microwave technology-Techniques and applications in MORE chemistry. Sonochemical synthesis. Applications of sonication in the synthests of organic compounds.

CH 233 Physical Chemistry -III

Total 90 h

Unit I Computational chemistry. 18 h

Introduction to computational chemistry, concept of potential energy surface(PES), stationary point, saddle point and geometry optimisation.

Basis sets, STO, Gaussian functions and its properties, GTO, contracted Gaussians, minimal , split valance, polarised and diffused basis sets.

Introduction to SCF. Wave function for open shell state, RHF, ROHF and URHF. Model Chemistry. Brief description of computational methods- ab-initio, semiempirical and density

functional and molecular mechanics methods. Construction of Z-matrix for simple molecules- H_2O, H_2O_2, H_2CO, CH_3CHO, NH_3, and CO_2.

Unit II Spectroscopy II 18 h

Resonance spectroscopy: Nuclear Magnetic resonance Spectroscopy, Nuclear spin. Interaction between nuclear spin and applied magnetic field. Proton NMR . Population of energy levels. Nuclear resonance. Chemical shift. Relaxation methods. Spin-spin coupling. Fine structure. Elementary idea of 2D and 3D NMR. Introduction to instrumentation.

ESR spectroscopy: Electron spin. Interaction with magnetic field. Kramer's rule. The g factor. Determination of g values. Fine structure and hyperfine structure. Elementary idea of ENDOR and ELDOR.

Mossbauer spectroscopy: Basic principles. Doppler effect, chemical shift, recording of spectrum, application. Quadrupole effect. Principle and application of NQR spectroscopy.

Photoelectron spectroscopy. Introduction to UV photoelectron and X-ray photoelectron spectroscopy.

Unit III Statistical mechanics II 18 h

Complex partition functions and partition function for particles in different force fields. Langevin's partition function and its use for the determination of dipole moment. Electrostatic energies. Molecular partition functions. Translational, vibrational, rotational and electronic partition functions. Total partition functions , partition functions and thermodynamic properties. The principle of equipartition of energy. Chemical equilibrium. Law of mass action. Transformation of the equilibrium expressions. Statistical derivation.

Real gases, intermolecular potential and virial coefficients. Equipartition principle and Quantum theory of heat capacity. Calculation of heat capacity of gases, limitation of the method. Heat capacity of solids. Dulong and Petit's law, Kopp's law, Classical theory and its limitation. The vibrational properties of solids. Einstein theory of heat capacity. The spectrum of normal modes. Limitations of Einstein's theory. The Debye theory, the electronic specific heat. Structure and thermal properties of liquids. Pair correlation functions.

Unit IV Surface chemistry and catalysis 18 h

Different types of surfaces. Properties of surface phase. Thermodynamics of surface. Surface tension of solutions. Gibb's adsorption equation and its verification. Surfactants and miscelles Examination of surfaces using low energy electron diffraction, photoelectron spectroscopy, ESCA, scanning probe microscopy, Auger electron spectroscopy , SEM and TEM.

Surface films: different types, Surface pressure and Surface potential, and their measurements and interpretation.

The Gas- solid inter phase. Types of adsorption. Heat of adsorption, The Langmuir theory- kinetic and statistical derivation. Multilayer adsorption- the BET theory and Harkins- Jura theory. Adsorption from solutions on solids. Langmuir and classical isotherms. Chemisorption-. differences with physical adsorption. Adsorption isotherms, adsorption with dissociation. Adsorption with interaction between adsorbate molecules.

Measurement of surface area of solids: Harkins – Jura absolute method, entropy method and the point B method. Use of Langmuir, BET and Harkins – Jura isotherms for surface area determination.

Catalysis: Mechanism and theories of homogeneous and heterogeneous catalysis. Enzyme catalysis, Bimolecular surface reactions. Langmuir – Hinshelwood mechanism

Instrumental methods of catalyst characterization- diffraction and thermal methods, spectroscopic and microscopic techniques.

Unit V Electro Analytical and spectrophotometric methods. 18 h

Potentiometric methods: Reference electrodes and indicator electrodes. The hydrogen, calomel, Ag-AgCl electrode. The glass electrode- its structure, performance and limitations. Measurement of pH. Potentiometric titrations- redox and precipitation titrations. Electrogravimetry: Principle and method. Determination of Copper. Separation of metals. Conductometry: principle and method. Conductometric titrations. Coulometry: Principle and method. Coulometric titrations. principle and method of polarography, Voltametry, cyclicvoltammetry, stripping voltammetry and amperometry.

Flame emission and atomic absorption spectrometry. Instrumentation for AAS. The flame characteristics. Atomiser used in spectroscopy. Hollow cathode lamp. Interference in AAS. Application of AAS.

CH 234 Inorganic Chemistry Practicals -II Total-125 h

1. Estimation of simple mixture of ions (involving quantitative separation) by volumetric and Gravimetric methods.
2. Analysis of typical alloys and ores
3. Ion exchange separation of binary mixtures.
4. Spectral Interpretation of metal complexes using IR, UV-Vis. spectral data. Supplementary information like metal estimation, CHN analysis, conductivity measurements and magnetic measurements to be provided to the students. Assessment is based on arriving at the structure of the complex and assignment of IR spectral bands.
5. Interpretation of TG and DTA curves of metal oxalates/acetates/sulphates/chlorides in hydrated forms. Assessment is based on the identification of various stages.

CH 235 ORGANIC PRACTICALS-II

Total 125 h

A.**Volumetric estimation** of

1) Aniline 2) Phenol 3) glucose

4) Iodine value and saponification value of coconut oil

B). **Colorimetric estimation** of 1) Aniline 2) Glucose 3) Cholesterol 4) Ascorbic acid 5) Streptomycin or Aspirin.

C). Spectral identification (UV, IR, ^{1}H NMR, ^{13}C NMR, EI mass) of Organic compounds from a library of organic compounds

D. Separations of mixtures by Paper Chromatography

1) Separation of amino acids 2) Separation of dyes

E) Three stage preparation

1)Benzaldehyd**e** ⟶ Benzoin(green synthesis with thiamine HCl) ⟶ benzil ⟶ benzilic acid

2) Phthalic acid⟶ Phthalic anhydride ⟶ pthalimide ⟶ anthranilic acid

CH 236 PHYSICAL PRACTICALS –II **Total 125 h**

1. Conductometry

Determination of strength of strong and weak acids in a mixture

Determination of strength of a weak acid.

Determination of solubility product of a sparingly soluble salt ($PbSO_4$, $BaSO_4$ etc.)

Hydrolysis of NH_4Cl or CH_3COONa or aniline hydrochloride

Determination of order of reaction, rate constant and energy of activation for saponification of ethyl acetate

Precipitation titrations.

Determination of critical micellar concentration (CMC) of sodium lauryl sulphate from measurement of conductivities at different concentrations.

Equivalent conductance at infinite dilutions and verification of Kohlraush's Law.

Determination of Onsager constants.

2. Potentiometry

Determination of emf of Daniel cell.

Determination of the emf of various $ZnSO_4$ solutions and hence the concentration of unknown $ZnSO_4$ solution.

Determination of valency of mercurous ion.

Determination of temperature dependence of EMF of a cell

Determination of stoichiometry and formation constant of silver-ammonia complex.

Determination of activity and activity constant of electrolytes.

Determination of thermodynamic constants of reactions.

pH metric titrations.

Acid alkali titrations using Quinhydrone electrode.

Titrations(double) involving redox reactions – Fe^{2+} Vs $KMnO_4$, $K_2Cr_2O_7$, $Ce(NH_3)SO_4$ and KI Vs $KMnO_4$

Determination of strengths of halides in a mixture.

Determination of pH of buffer solutions and hence to calculate the E_0 of quinhydrone electrode

3. Spectrophotometry

Verification of Beer-Lambert's law.

Absorption spectra of conjugated dyes.

Determination of concentration of potassium dichromate and potassium permanganate in a mixture.

To study the complex formation between Fe^{3+} and salicylic acid.

Determination of pKa of an indicator.

4. Polarimetry

Measurement specific rotation of glucose.

Determination of specific rotation of sucrose

Determination of unknown concentration of glucose solution.

and rate constant of its hydrolysis in presence of HCl

5. Polarography :

Determination of half wave potential E ½ and unknown concentration of Cd^{2+} ion.

Determination of concentrations of metal ions in a mixture.

6. Surface tension

Determination of surface tension of various liquids by Stalagmometric method (drop number / drop weight)

Determination of parchors of molecules and various groups.

Determination of concentration of a mixture.

Determination of surface tension and parachor of liquids using double capillary method.

7. Refractometry

Determination of molar refraction of pure liquids

Determination of concentration of KCl solution/glycerol solution

Determination of solubility of KCl in water.

Determination of molar refraction of solid KCl

Study the stoichiometry of potassium iodide-mercuric iodide complex.

Determination of concentration of KI solution.

8. Viscosity

Determination of viscosity of various liquids using Ostwald,s viscometer.

Determination of unknown composition of given liquid mixture like toluene-nitrobenzene.

Verification of Kendall's relation.

Verification of Jon Dole's equation.

SEMESTER IV

CH 241 (a) ADVANCED INORGANIC CHEMISTRY

Total 90 h

Unit I Spectroscopic methods in inorganic chemistry-I 18 h

Infrared and Raman spectroscopy: Vibrational modes, group frequencies of infrared systems, factors affecting the group frequencies, study of hydrogen bonding effects, infrared spectra of coordination compounds. Structural elucidation of coordination compounds

containing the following molecules/ ions as ligands- NH_3, H_2O, CO, NO, OH^-, SO_4^{2-}, CN^-, SCN^-, NO_3^- NO_2^- CH_3COO^- and X^- (X= halogen).

Changes in ligand vibration on coordination with metal ions. Vibrational spectra of metal carbonyls- CD and ORD spectra of metal complexes.

Physical characterization of inorganic compounds by UV, NQR and MS techniques.

Unit II Applications of group theory 18 h

Hybrid orbitals and molecular orbitals for simple molecules. Transformation properties of atomic orbitals. Hybridastion schemes for σ and π bonding with examples. MO theory for AB_n type molecules. Molecular orbitals for regular octahedral, tetrahedral and metal sandwich compounds.

Ligand field theory: Splitting of d orbitals in different environments using group theoretical considerations. Construction of energy level diagrams. Correlation diagram. Method of descending symmetry. Tanabe-Sugano diagrams. Selection rules for electronic spectra. Molecular orbitals in octahedral complexes. Formation of symmetry adapted group orbitals of ligands. MO diagram.

Symmetry and selection rules: Symmetry properties of common orbitals. Application of character tables to infrared and Raman spectroscopy. Infrared and Raman active modes for C_{2v}, C_{3v} and D_{4h}

Unit III Spectroscopic methods in Inorganic chemistry -II 18 h

ESR spectra of metal complexes: Hyperfine splitting and A parameter, g values, zero field splitting and Kramers degeneracy. Application to Cu(II) complexes and inorganic free radicals such as PH_4, F_2^- and $[BH_3]^-$.

Nuclear Magnetic Resonance Spectroscopy :The contact and pseudocontact shifts, factors affecting nuclear relaxation, some applications including biological systems, an overview of NMR of metal nuclides with emphasis on ^{31}P and ^{19}F NMR.

Mossbauer Spectroscopy : Basic Principles, spectral parameters and spectrum display. Application of the technique to the studies of iron and tin complexes.

Unit IV Metal-metal bonds and metal clusters 18 h

Metal-metal bonds: Factors affecting the formation of metal-metal bond. Dinuclear compounds of Re , Cu and Cr, metal-metal multiple bonding in $(Re_2X_8)^{2-}$, Trinuclear clusters, tetranuclear clusters, hexanuclear clusters. Polyatomic zintl anion and cations. Infinite metal chains. Metal carbonyl clusters. Anionic and hydrido clusters. LNCCs and HNCCs. Isoelectronic and isolobal relationships. Hetero atoms in metal clusters: Carbide and nitride containing clusters. Electron counting schemes for HNCCs. Capping rule. Chalcogenide clusters. Chevrel phases.

Unit V Bioinorganic chemistry 18 h

Copper on biochemical systems. Oxidase activity, super oxide dismutase activity. Electron transport in biology. Structure and function of copper proteins in electron transport process. Oxygen transport copper proteins. Hemocyanin- copper transport, copper enzymes-Azurin, plastocyanin.

Inorganic medicinal chemistry. Metals in medicine. Metal toxicity and homeostasis. Metal deficiency and diseases. Toxic effects of metals. Effect of deficiency and excess of essential metal ions. Toxicity due to non essential elements and speciation. Detoxification mechanism. Role of lithium and aluminium in biological systems. Chelation therapy and chemotherapy. Anticancer drugs and vanadium based diabetic drugs.

CH 241 (b) - ADVANCED ORGANIC CHEMISTRY

Unit I Reagents in organic synthesis 18 h

Applications of hydrogenation catalysts, hindered boranes, bulky metal hydrides. $NaCNBH_3$, DIBAL, Li trialkylborohydrides, tri-n-butyl tin hydride, diimide, Lindlar catalysts and aluminium alkoxide. Rosenmund reduction and McFadeyan-Stevens reaction. Oxidation using SeO2, lead tetraacetate, ozone, peracids, DDQ, manganese 1V oxide, silver carbonate and Cr(V1) reagents. Swern oxidation, Moffatt oxidation, allylic and benzylic oxidation. Sommelet reaction. Elbs reaction. Oxidative coupling of phenols. Sharpless asymmetric epoxidation. Chemo and regioselectivity in reductions and oxidations. Use of XeF_2, SbF_5, VF_5, MoF_6, CF_3OF, SF_4, HF and F_2as fluorinating agents.

Unit II Organomatallic chemistry 18 h

Preparation of organo Mg, Al, Li, Cu, Zn, Cr, Fe, Ce and sulphur stabilised compounds. Reactions of Grignard reagents in organic synthesis. Alkylation, oxirane addition, carbondioxide addition, carbonyl addition, enone addition (1,2 and 1,4additions), reduction, conjugate addition and enolisation reactions. Selectivity in Grignard reactions. Reactions of organo Li reagents, Li exchange reaction, its use in the preparation of RLi compounds,

addition to C=O, COOH and $CONR_2$, Li dialkyl cuprates (Gilman reagent)-preparation and reaction with alkyl halides, aryl halides, with enones. Alkynyl Cu(1) reagents, Glaser coupling. Dialkyl Cd compounds- preparation and reaction with acyl halides. Benzenetricarbonyl chromium- preparation and reaction with carbanions. Tebe reagent, Silane carbanion and its reactions.

Unit III Organic synthesis 18 h

C-C and C=C bond forming reactions. Mannich, Riemer-Tiemann, Simon-Smith, Vilsmeier-Hack, Ullmann and Chichibabin reactions. Ring formation by Dieckmann, Kostanecki, Thorpe, Pschorr and acyloin condensations. Stork enamine, Shapiro, Peterson, Heck, Stille, Ritter and Prilezhaev reactions. Synthesis of small rings. Simon-Smith reaction. Reduction and oxidation in synthesis. Catalytic hydrogenation. Alkali metal reduction, Birch reduction, Wolff-Kishner reduction and Clemmenson reduction. Huang-Milon modification. Boranes, LAH and sodiumborohydride as reductants. Hydrogenations, Oppenauer oxidation, Jones oxidation. Applications of HIO_4, OsO_4 and mCPBA.

Unit IV Methods in organic synthesis 18 h

Sterospecific and steroselective synthesis, Sharpless asymmetric epoxidation, Chiral pool, chiral auxiliary, Chiral reagents, BINAP, Regioselectivity in enol and enamine alkylation. Stereoselective and stereospecific synthesis. Mitsunobu reaction. 1,3-dipolar cycloaddition in the construction of rings. Story synthesis. Olefin synthesis by extrusion reactions. Olefin metathesis. Umpolung. Reductive coupling reactions. Epoxide to alkene. Introduction to combinatorial synthesis. Electrochemical reduction of organic halogen, nitro and carbonyl compounds. Electrochemical Kolbe oxidation. Tetrahydropyranyl, silyl, t-butyl, trichloroethyl, acetal and thioacetal as hydroxyl, thiol, carboxyl and carbonyl protecting groups in synthesis.

Unit V Chemistry of biopolymers and polymers 18 h

Peptide bond formation methods. Amino and carboxy protection in SPPS. Synthesis of A, G, C, T, U adenosine, ADP and ATP. Automated polypeptide and oligonucleotide synthesis. Structure organization of proteins and poly nucleotides. Protein sequencing by Edmans method. Protein denaturation. Structure of polysaccharides including starch, cellulose, glycogen and chitin. Classes of polymers-Types and mechanisms of polymerization reactions. Methods of molecular mass and size distribution determination. Polymer structure

and property characterization. Synthesis of stereo regular polymers. Ziegler-Natta catalyst. Polymers in organic synthesis- supports, reagents and catalysts. Bio degradable polymers.

SEMESTER IV

CH 241(c) ADVANCED PHYSICAL CHEMISTRY

Total 90 h

Unit I Applications of group theory 18 h

Spectroscopic applications: Transition moment integral transition moment operator. Vanishing matrix element. Symmetry selection rule for IR, Raman and electronic spectra. Dipole and polarizability transition moment operator. Identification of IR and Raman active normal modes in molecules coming under various point groups such as C_{2v}, C_{3v},C_{4v}, D_{3h}, T_d and O_h. Mutual exclusion and complementarity principle of IR and Raman spectra and their use in the identification of molecular structures. Probability of overtone and combination bands. Identification of allowed and forbidden electronic transitions in carbonyl groups. Vibronic transitions.

Application to MO theory: Symmetry adapted LCAO-MO theory of π-bonded hydrocarbons. Projection operator and its use in the construction of wave functions of π-molecular orbitals, secular equations and use of symmetry for simplifying the calculations of energy and wave functions of ethylene, butadiene and carbocyclic systems such as benzene and naphthalene.

Unit II Exactly solvable systems. 18 h

Simple Harmonic Oscillator: Wave equation for ID harmonic oscillator. Complete solution and their properties. Three dimensional Harmonic oscillator. Potential energy in

three dimension and Schrodinger wave equation in Cartesian coordinate. Separation of variables and solution of the equation for energy and wave function. Degeneracy.

Rigid rotor: Schrodinger equation in polar Coordinate. Angular momentum operator for rigid rotor. Separation of variables and complete solution for phi and theta equations. Legendre polynomials and associated Legendre functions. Normalisation of associated Legendre functions and evolution of the values of orbital angular momentum quantum number. Recursion relations. Rigid rotor wave function and energy.

The Hydrogen atom: Schrodinger wave equation in polar coordinate. Separation of variables and complete solution of the radial part. The associated Laguarre polynomial. Normalisation. The evolution of the value of the principal quantum number. The spherical harmonics and the radial part of the wave function. The total wave function of H atom. The wave functions of Hydrogen like atomic orbitals and explanations for the shapes of various orbitals.

Angular momentum, angular momentum operators(L_x,L_y,L_z and L^2) and their commutation properties. Spherical harmonics as eigen functions of angular momentum operator L_z and L^2. Ladder operator method for angular momentum. Space quantisation.

Unit III Approximate method I 18 h

Schrodinger wave equation for He atom and anharmonic oscillator and difficulty to get the exact solution. The Variation method: Variation theorem and its proof. The variation integral and its properties. Variational parameters. Trial wave functions, Illustration of trial wave functions for calculation of H atom and particle in a 1D box as examples.

Trial functions as linear combination of orthonormal functions, linear combinations of functions containing variational parameters as trial functions. Setting up of secular determinants. Variation methods of normal state of He . The SCF method, SCF and variation method. Strength and limitation of the method.

Unit IV Approximate method II 18 h

The perturbation method. The generalised perturbation method. The idea of successive correction to unperturbed systems. First order perturbation. Correction of wave function and energy . Theory of non-degenerate level perturbation.The normal Helium atom. The first order perturbation of the degenerate level. The hydrogen atom. Second order perturbation theory. Correction for wave function and energy. Stark effect.

Time dependant wave equation: Variation in the state of a system with time. Emission and absorption of radiation. The Einstein's transition probability and its calculation. Selection rules and intensity of spectrum for harmonic oscillator , rigid rotor and hydrogen atom.

Unit V Computational methods 18 h

Computational methods as potential tools for practicing chemistry. Potential energy surface, saddle point, local minima and global minima. Geometry optimisation. Exchange and overlap integrals. Difficulty in evaluating them with H-like wave functions. Slater Type functions(STO), approximation of STO with Gaussian type functions. Contracted Gaussians.

Basis sets: minimal basis set, split valance basis set, polarised basis set and diffused basis set. Model chemistry and notations.

Geometry input- in terms of Cartesian coordinates and internal coordinates. Z-matrix, construction of z-matrices of simple molecules H_2, H_2O, H_2O_2, H_2CO,CH_3CHO, CH_4, C_2H_6 and with dummy atom, CO_2, NH_3,C_6H_6.

Molecular mechanics method: Force fields, potential energy expressions for bond stretching, bending, torsion, non-bonded interactions, electrostatic interaction and H-bonding. Setting up of force field expressions. Method of parameterisation. Use of molecular mechanics. Brief introduction to commonly using force fields(MM3, MMFF, AMBER and CHARMM) and Softwares.

Ab-initio method: Hartree-Fock Self Consistent Field method. Slater determinant. Post Hartree-Fock methods- Configuration Interaction(CI) and Moller Plesset(MP)methods.

Semiempirical method: Basic principle of the method. Its variants, ZDO,CNDO and INDO. Density Functional method: Functional. Hohenberg-Kohn theorems. Kohn-Sham orbitals. Basic idea of Local Density(LD) approximation, Generalised Gradient approximation and hybrid (BLYP, B3LYP) methods.

Comparative study of Molecular Mechanics, Ab-initio method, Semi-empirical method and DFT method of computations.

CH 242 DISSERTATION

Each of the students has to carry out original research in a topic in accordance with the Elective paper chosen for Semester IV under the guidance and supervision of a teacher in the concerned Department of the College.

Instructions to Question Papers Setters

The Syllabus of each theory has five units. While setting the question papers, equal weight is to be given to each of the Units for choosing the questions. Each question paper is of 3 hours duration and has three Sections, namely Section A, Section B and Section C constituting a total 75 marks as detailed.

Section A- Five questions, one from each Unit containing three short answer questions marked (a), (b), and (c), each of which has 2 marks. One has to answer any two of (a), (b) or (c) from each of the five questions. (2x10 = 20 marks)

Section B- Five questions, one from each Unit containing two short essay questions marked (a) and (b), each of which has **5** marks. One has to answer either (a) or (b) from each of the five questions. (5x5 = 25 marks)

Section C- Five essay questions, one from each unit having 10 marks. One has to answer any three questions from the five questions asked.(10x3 = 30 marks)

M.Sc. PROGRAMME IN BRANCH IV - ANALYTICAL CHEMISTRY

(Revised syllabus under semester system with effect from 2013 admission)

SYLLABUS AND SCHEME OF EXAMINATION

Course No. and Title	Hours per week		Duration of ESA in hours	Marks for CA	Marks for ESA	Total marks
	L	P				
SEMESTER I*						
CL 211 Inorganic Chemistry I	5		3	25	75	100
CL 212 Organic Chemistry I	5		3	25	75	100
CL 213 Physical Chemistry I	5		3	25	75	100
CL 214 Inorganic Practicals I		3	(To be continued in Semester II)			
CL 215 Organic Practicals I		3	(To be continued in Semester II)			
CL 216 Physical Practicals I		4	(To be continued in Semester II)			
			Total marks for semester 1			300
*Distribution of teaching hours/week: Theory- 15 hours, Practicals- 10 hours (1 hour for Seminar)						
SEMESTER II*						
CL 221 Inorganic Chemistry II	5		3	25	75	100

M.Sc. PROGRAMME IN BRANCH IV – ANALYTICAL CHEMISTRY

(Revised syllabus under Semester System w.e.f. 2013 Admission)

SEMESTER I

CL 211 INORGANIC CHEMISTRY - I

Total 90 h

Unit I Noble gases, halogens, isopoly and heteropoly acids 18 h

Noble gas compounds: Preparation, properties, structure and bonding. Halogens in positive oxidation states. Preparation, properties, structure, bonding and uses of inter halogen compounds, pseudo halogens, poly halide ions. Astatine: Synthesis, stability and properties.

Preparation, properties and structure of isopoly and heteropoly acids of Mo and W. Classification, preparation, properties and structure of borides, carbides, nitrides and silicides. Classification and structure of silicates. Properties and structure of aluminosilicates and zeolites. Preparation, properties and applications of silicones.

Unit II Coordination chemistry-I: Theories of metal complexes 18 h

Types of ligands and complexes. Isomerism: Geometrical, optical and structural isomerism. Stability of complex ions in aqueous solutions: Formation constants. Stepwise and overall formation constants. Factors affecting stability of complexes. Trends in stepwise constants. Determination of stability constants: spectrophotometric, polarographic and potentiometric methods. Stability of chelates. Thermodynamic explanation, macrocyclic effects.

Crystal field theory: Splitting of d orbitals in octahedral, tetragonal, square planar, tetrahedral, trigonal bipyramidal and square pyramidal fields. Jahn-Teller theorem, dynamic-static -evidence for JT effect. Crystal field stabilization energy (CFSE) and its calculations. Octahedral Site Stabilization Energy. Thermodynamic effects of CFSE. Factors affecting the splitting parameter. Spectrochemical series. Ligand field theory. Molecular orbital theory. Sigma and pi bondings in complexes. MO diagrams of octahedral complexes with and without pi bonds. Effect of pi bond on the stability of sigma bond. Nephelauxetic effect. Critical comparison of the three theories.

Unit III Analytical principles **18 h**

Evaluation of analytical data: Accuracy and precision. Standard deviation, variance and coefficient of variation. Student 't' test. Confidence limits. Estimation of detection limits. Errors: Classification, distribution, propagation, causes and minimization of errors. Significant figures and computation rules. Correlation analysis: Scatter diagram. Correlation coefficient, r. Calculation of r by the method of least squares.

Volumetric methods: Classification of reactions in volumetry. Theories of indicators. Acid-base, redox, adsorption, metallochromic, fluorescent and chemiluminescent indicators. Complexation titrations: Titration using EDTA. Precipitation titrations. Redox titrations. Gravimetric methods: Mechanism of precipitate formation. Aging of precipitates. Precipitation from homogeneous solutions. Coprecipitation and postprecipitation. Contamination of precipitates. Washing, drying and ignition of precipitates. Organic reagents used in gravimetry: Oxine, dimethylglyoxime and cupferron.

Unit IV Nanomaterials **18 h**

General introduction to nanomaterials and emergence of nanotechnology, Moore's law, synthesis and properties of fullerenes and carbon nanotubes, synthesis of nanoparticles of gold, silver, rhodium, palladium and platinum. Techniques of synthesis- electroplating and electrophoretic deposition, conversion through chemical reactions and lithography. Thin films- chemical vapour deposition and atomic layer deposition techniques.

Elementary idea of characterization of nanomaterials using XRD powder, TEM, AFM, SEM and STM techniques.

Diversity in nanosystems: self assembled monolayers on gold-growth process and phase transitions. Gas phase clusters- formation, detection and analysis. Quantum dots- preparation, characterization and applications.

Unit V Chemistry of natural environmental processes **18 h**.

The chemistry of processes in atmosphere: Composition of the atmosphere: Automobile pollutants and the catalytic converter. Photochemical smog. Chemistry of the stratosphere. Catalytic destruction of ozone. Depletion of the protective ozone layer. Effects of air pollutants on the human health.

The Chemistry of processes in hydrosphere: The hydrologic cycle. Cycling and purification. The unique properties of water. Acid base properties. CO_2 in water. Alkalinity. O_2 consuming waste.

The chemistry of processes in Lithosphere: Redox status in soil. pE pH predominance diagrams for redox sensitive elements. Acidity in soil materials.Acid neutralization capacity and the quantification of the soil acidity. Ion speciation in soil solution. Quantitative aspects of ion speciation. Cation exchange capacity and exchange phase composition.

CL 212 ORGANIC CHEMISTRY - I

Total 90 h

Unit I Stereochemistry of organic compounds 18 h

Nomenclature of organic compounds, Fused polycyclic hydrocarbons, Bridged polycyclic hydrocarbons, Bridged fused systems, Spirocyclic hydrocarbon systems, Heterocyclic systems,Metal organic compounds.

Molecular chirality, stereochemical nomenclature, prostereoisomerism, stereotopicity and stereoprojections. Non-carbon chiral centres. Introduction to ORD, CD configuration and their application in assigning configuration and conformation. Octant and axial haloketone rules. Cotton effect. Stereochemistry of nitrogen and phosphorus containing compounds. Atropisomerism and its designation. Stereoselectivity, enantiomeric excess and chiral separation methods. Conformational analysis of alkanes, cycloalkanes and biased systems. Effect of conformation on reactivity of cyclohexane and decalin derivatives. Chiral drugs.

Unit II Structure, reactivity and intermediates 18 h

Electronic and steric effects. Influence of structural features on acidity, basicity and reactivity of organic compounds. Structure, formation and properties of carbens, nitrenes and arynes. Singlet and triplet carbenes, formation and reactions. Carbon radicals: Structure, formation and stability. Radical reactions, autoxidation and radical chain reactions. Structure, stability and formation of carbocations, carbanions. Arynes: Formation and structure. S_N1, S_NAr, benzyne and $S_{NR}1$ mechanism in aromatic nucleophilic substitution.Orientation effects of substituents in aromatic electrophilic substitutions.

Unit III. Substitution and elimination reactions 18 h

Nucleophilic susbstitution at sp^3carbon, its mechanisms and stereochemical aspects. Effect of solvent, leaving group and substrate structure. S_N^1 , S_N^2, S_N1^1, S_N2^1, S_Ni reactions. Neighbouring group participation. Non-classical carbocations. Elimination reactions leading to C=C ond formation and their mechanisms. E1, E2 and E1CB mechanisms. Stereoaspects

of C=C bond formation. Effect of leaving group and substrate structure. Hoffmann and Saytzeff elimination. Cis elimination. Competition between S_N^1 and S_N^2, E1and E2, Alkyl halides as survival compounds

Unit IV Reactivity of unsaturated systems 18 h

Stereoaspects of the addition of X_2, HX, boranes and hydroxylation to C=C systems**.** Effect of substituents on the rate of additions. Cis and trans hydroxylation of cycloalkenes. Nucleophilic addition to activated C=C systems. Michael addition. Mechanism, with evidence of Aldol (normal, crossed and directed), Perkin, Stobbe, Knovenagel, Darzen, Reformatsky and benzoin condensations. Grignard, Cannizaro, Wittig and Wittig-Horner reactions. Mechanism and stereochemistry of addition to C=O systems. Cram's rule, Felkin-Anh model, Mechanism of esterification and ester hydrolysis. Structure of the transition state in the addition reactions.

Unit V Separation techniques 18 h

Classification of chromatographic methods. Theory of chromatography. Applications of chromatographic methods. Adsorption and partition chromatography. Paper, thin layer and column chromatographic methods. Centrifugal TLC, LC, Pressure column chromatography, HPLC and GC. Column matrices. Detectors. Affinity and chiral separations using HPLC. Normal and ultra centrifugation. Gel and Capillary electrophoresis and their applications. Solvent extraction. Extraction using supercritical liquid CO_2, Craig's technique of iquid liquid extraction.

CL 213 PHYSICAL CHEMISTRY -I

Total 90 h

Unit I Quantum Mechanics 18 h

Experimental foundation of quantum mechanics- The black body radiation, Compton effect, photoelectric effect, atomic spectra. Failure of classical mechanics, need of quantum mechanics. Concept of matter wave, de Broglie relation and its experimental proof, Uncertainty principle and its consequences.

The postulates of quantum mechanics: Wave function postulate- wave function and its physical meaning, well behaved functions, boundary conditions, orthogonality and orthonormality. Operator postulate- Laplacian and linear operators. Angular momentum operators and commutators. Hamiltonian operator and its properties. Eigen value postulate- eigen value equations and eigen functions. Expectation value postulate. Postulate of time-dependent Shrodinger equation.

Application to simple systems: Solution of Schrodinger wave equation for a free particle, particle on a ring, particle in 1D box, particle in 3D box, separation of variables, degeneracy.

One dimensional Harmonic oscillator- Complete solution. Hermite polynomials, recursion formula, features of the wave functions.

Hydrogen like systems- wave equation in polar coordinate. Separation of variables. R, theta and phi equations. Solution of phi equation. Wave functions of hydrogen like systems. Orbital and radial functions. Radial distribution functions, angular functions and their plots.

Stern-Gerlach experiment. The postulate of spin. Spin orbitals. Many electron atoms. Qualitative idea of self consistant field method. The exclusion principle. Vector atom model. Spin-orbit coupling. Term symbols and explanation of spectral lines.

Unit II Molecular symmetry **18 h**

Symmetry and Character table: Symmetry elements and symmetry operation. Matrix representation of symmetry operations. Character of a matrix. Conditions for a set of elements to form a group. Point groups. Multiplication of operations. Group multiplication table. Similarity transformation and classification of symmetry operation, Matrix representation of point group. Reducible and Irreducible representations. The Great Orthogonality theorem. Rules derived from GOT (proof not required). Setting up of character table of C_{2v}, C_{3v} and C_{2h} groups. Direct product representations.

Reduction formula, reduction of reducible representation to IRs. Transformation properties of atomic orbitals. Hybridisation: identification of atomic orbitals taking part in hybridisation of triangular planar, square planar, triagonal bipyramidal, square pyramidal and tetrahedral molecules. Molecular symmetry and optical activity.

Unit III Basics of Chemical Thermodynamics . **18 h**

First and second laws of Thermodynamics. Concept of entropy, Free energy. Criteria of Spontaneity and equilibrium. Fundamental equations for open system. Euler's relation. Maxwell relations. Thermodynamic equations of state. Third law of Thermodynamics. Apparent exceptions to the third law. Applications of third law.

Properties of mixtures: Thermodynamics of ideal and non ideal solutions. Partial molar quantities, Chemical potential. Duhem- Margules equation. , Konowaloff's law, Excess thermodynamic functions. Determination of Partial molar properties.

Fugacity and Activity: Fugacity of gases, its determination. Variation of Fugacity with temperature and Pressure. Fugacity of liquids and solids. Fugacity of mixtures of gases. Lewis Randall rule. Fugacity in liquid mixtures. Activity and Activity coefficients. Determination of activity and activity coefficients of electrolytes and non electrolytes.

Reaction Isotherm and spontaneity of reaction. Variation of Equilibrium constant with temperature and pressure. Variation of standard free energy with temperature. Simultaneous equillibria and addition of free energies. Standard free energy of formation and its determination, Free energy functions.

Unit IV Chemical Kinetics 18 h

Complex reactions, Reversible, Consecutive, Concurrent and branching reactions. Free radical and chain reactions. Steady state treatment. Reactions like H_2-Cl_2, H_2-Br_2, and decompositions of ethane , acetaldehyde and N_2O_5. Rice-Herzfeld mechanism, Potential energy surfaces-adiabatic and non adiabatic curve crossing processes. Unimolecular reaction. Lindemann treatment. Semenoff-Hinshelwood mechanism of chain reactions and explosion.

Kinetics of fast reactions: Relaxation method, relaxation spectrometry, flow method, shock method, fast mixing method, field jump method, pulse method Flash photolysis and NMR method.

Theories of Reaction rate : Arrhenius equation and its limitations, activation energy , Collision theory and absolute reaction rate theory. Free energy of activation and volume of activation. Thermodynamic formulation of reaction rate. Effects of pressure and volume on the velocity of gas reaction.

Reactions in solution: Comparison between reactions in gas phase and in solution. Factors determining reaction rates in solution. Reaction between ions and influence of ionic strength. Primary and secondary kinetic salt effects. Influence of solvent on reaction rate. Significance of volume of activation. Hammet and Taft equation.

Photochemistry: Effect of radiation on the rate of reaction. Laws of photochemistry. Quantum yield. Photo chemical reactions of H_2-Cl_2, H_2-Br_2.

Unit V Gases, liquids and liquid crystals 18 h

Random movement of molecules: Brownian movement and determination of Avogadro number. The distribution of molecular velocities. Derivation and discussion on Maxwell's equation. Derivation of average and most probable velocities from Maxwell's equation. Influence of temperature on molecular velocities . Molecular collision and mean free path. Homogenous and heterogeneous collisions. Collision of molecules with surface and effusion. Effect of molecular interactions on collision. Transport properties: Viscosity, thermal conductivity and diffusion. Determination of viscosity of gases. Influence of temperature and pressure on transport properties.

Liquid state: X-ray diffraction study of simple liquids and their structure. Oscillator theory of liquid state. Specific heat of liquids.

Liquid crystals: Mesomorphic state, types, examples and applications of liquid crystals. Theory of liquid crystals.

CL 214 INORGANIC CHEMISTRY PRACTICALS -1

Total 125 h

1. Separation and identification of rare/less familiar cations such as Ti, W, Mo, Th, Zr, V, U and Li
2. Volumetric estimation using EDTA, ammonium vanadate, ceric sulphate etc.
3. Colorimetric/spectrophotomteric estimation of Cr, Fe, Mn, Ni, Cu etc.

4. Preparation of metal complexes: selection can be made from the following or any other from the existing literature.

   ii) $[Co(NH_3)_6]Cl_3$, (ii). $[Cu(NH_3)4]SO_4$ (iii) $K_3[Cr(C_2O_4)_3]$

   iv). $K_3[Fe(C_2O_4)_3]$, v). Cis and trans isomers of $[Co(en)_2Cl_2]Cl$

   iv). $[Cr(en)_3]Cl_3$

CL 215 ORGANIC PRACTICALS-1

Total 125 h

A . Separation and identification of organic compounds

1. Quantitative wet chemistry separation of a mixture of two components by solvent extraction

2. Purification of the separated samples by boiling and crystallization.

3. TLC of the purified samples along with the mixture in same TLC plates (if not possible use separate plates) and calculation of R_f values.

B. Separation of a mixture of by column chromatography

1) Malachite green and methylene blue 2) O-nitroaniline and p-nitroaniline.

C. Preparation of compounds by two stages.

TLC analysis of the products and original compound in the same plate and measurement of Rf values. Recording UV, IR, NMR and mass spectrum of synthesized compounds.

1) Acetanilide- ⟶ p-nitroacetanilide ⟶ p-nitroaniline

2) Methylbenzoate ⟶ m-nitromethylbenzoate ⟶ m-nitrobenzoic acid

3) Acetanilide- ⟶ p-bromoacetanilide ⟶ p-bromooaniline

E. Green Organic Chemistry experiments

1) Acetanilide- ⟶ p-bromoacetanilide (KBr and CAN)

2) Benzophenone ⟶ Benzopinacol (photoreduction)

CL 216 PHYSICAL PRACTICALS –I

Total 125 h

1. Adsorption

Freundlich and Langmuir isotherms for adsorption of acetic/oxalic acid on active charcoal.

Determination of concentration of acetic/ oxalic acid.

2. Kinetics

Determination of rate constant of acid hydrolysis of methyl acetate.

Determination of Arrhenius parameters.

Determination of concentration of given acid.

Determination of rate constant of the saponification of ethyl acetate and evaluation of Arrhenius parameters.

Determination of rate constant of reaction between $K_2S_2O_8$ and KI.

Study the kinetics of iodination of acetone in acid medium.

3. Phase rule

Solid-liquid equilibria – Construction of phase diagram and determination of the composition of unknown mixture (naphthalene/biphenyl, naphthalene/benzophenone, naphthalene/diphenyl amine)

Construction of phase diagram with congruent melting point- naphthalene/meta-dinitrobenzene

4. Partially miscible liquid pairs- CST of phenol-water system.

Effect of impurities (KCl/ NaCl/ succinic acid) on the miscibility temperature of phenol-water system and hence the concentration of given unknown solution.

Three component system- Construction of ternary phase diagram of acetic acid-chloroform-water system and hence the composition of given homogeneous mixture.

Construction of tie-line.

5. Distribution law

Distribution coefficient of iodine between CCl_4 and water

Distribution coefficient of benzoic acid between toluene and water.

Determination of the equilibrium constant of the reaction $KI+I_2 \rightarrow [KI_3]$ and hence the concentration of given KI.

Distribution coefficient of ammonia between chloroform and water.

Determination of equilibrium constant of copper- ammonia complex by partition method or coordination number of Cu^{2+} in copper-ammonia complex.

Determination of hydrolysis constant of anilinium hydrochloride.

6. Dilute Solutions

Determination of K_f of solid solvent, molar mass of non-volatile solute, mass of solvent and composition of given solution (Solvent- Naphthalene/Biphenyl/ Benzophenone etc. Solute- Naphthalene/ Biphenyl/ Diphenylanmine etc)

Determination of vant Hoff's factor for benzoic acid in Naphthalene.

Determination of atomicity of sulphur.

7. Transition temperature

Determination of K_T of salt hydrate, molar mass of solute, mass of salt hydrate and composition of given solution (Solvent- $Na_2S_2O_3.5H_2O/CH_3COONa.3H_2O$, Solutes- glucose, sucrose, urea)

8. Thermochemistry

Determination of the concentration of given strong acid/alkali.

Thermometric titration of NaOH Vs standard HCl.

Heat of displacement of Cu^{2+} by Zn.

Determination of the heat of ionisation of acetic acid.

SEMESTER II

CL 221 INORGANIC CHEMISTRY –II

Total 90 h

Unit I Sulphur, nitrogen, phosphorus and boron compounds 18 h

Sulphur-nitrogen compounds: Tetrasulphur tetranitride, disulphur dinitride and polythiazyl S_xN_y compounds. S-N cations and anions. Other S-N compounds. Sulphur-posphorous compounds:

Molecular sulphides such as P_4S_3 , P_4S_7 , P_4S_9 and P_4S_{10} . Phophorous-nitrogen compounds: Phosphazines. Cylco and linear phosphazines. Other P-N compounds

Boron-nitrogen compounds: Borazine, substituted borazines and boron nitride. Boron hydrides: Reactions of diborane. Structure and bonding. Polyhedral boranes: Preparation, properties, structure and bonding. The topological approach to boron hydride structure. *Sytx* numbers. Importance of icosahedral framework of boron atoms in boron chemistry. Closo, nido and arachno structures. Structural study by NMR. Wade's rules. Carboranes. Metallocarboranes. Organoboron compounds and hydroboration.

Unit II Coordination Chemistry-II: Spectral and magnetic properties of transition metal complexes 18 h

Electronic spectra of metal complexes- Term symbols of d^n system, Racah parameters, splitting of terms in octahedral and tetrahedral fields. Correlation diagrams for d^n and d^{10-n} ions in octahedral and tetrahedral fields (qualitative approach), *d-d* transition, selection rules for electronic transition-effect of spin orbit coupling and vibronic coupling

Interpretation of electronic spectra of complexes- Orgel diagrams, Tanabe-Sugano diagrams, Calculation of Dq , B and β (Nephelauxetic ratio) values, charge transfer spectra.

Magnetic properties of complexes-paramagnetic and diamagnetic complexes, molar susceptibility, Gouy's method for the determination of magnetic moment of complexes, spin only magnetic moment. Temperature dependence of magnetism. Temperature Independent Paramagnetism (TIP). Spin state crossover, Antiferromagnetism-inter and intra molecular interaction. Application of magnetic measurements in the determination of structure of transition metal complexes.

Unit III Crystalline state 18 h

Crystal systems and lattice types. Bravais lattices. Crystal symmetry. Introduction to point groups and space groups. Miller indices. Reciprocal lattice concept. Close packed structures: BCC, FCC and HCP . Voids. Coordination number. Crystal binding: Molecular, covalent, metallic and hydrogen bonded crystals. X- Ray diffraction by crystals: Function of crystals. Transmission grating and reflection grating. Braggs equation. Diffraction methods: Powder, rotating crystal, oscillation and Weisenberg methods. Indexing and determination of lattice type and unit cell dimensions of cubic crystals.

Crystal defects: Perfect and imperfect crystals. Point, line and plane defects. Thermodynamics of Schottky and Frenkel defects. Colour centers in alkali halide crystals. Defect clusters. Extended defects: Crystallographic shear structure and stacking faults. Dislocations and crystal structure. Structure of compounds of AX (Zinc blende, Wurtzite) , AX_2 (Rutile, fluorite, antifluorite), A_mX_2 (Nickel arsenide), ABX_3 (Perosvskite, Ilmenite). Spinels. Inverse spinel structures.

Unit IV Lanthanides and actinides 18 h

Lanthanides: Characteristic properties. Electronic configurations and term symbols. Occurrence and extraction. Separation techniques. Oxidation states. Spectral and magnetic properties. Shapes of f orbital and their splitting in cubic ligand field. Actinides: Occurrence and general properties. Extraction of thorium and uranium. Electronic configuration and term symbol. Oxidation states. Spectral and magnetic properties. Comparative properties of lanthanides and actinides. Trans-uranium elements and their stabilities. Applications of lanthanide and actinide compounds. Comprehensive study of the beach sands of Kerala and their important components such as monazite, ilmenite, zircon and silminite.

Unit V Solid state chemistry 18 h

Electronic structure of solids. Free electron theory, band theory. Refinements to simple band theory, k space and Brillouin zones. Conductors, insulators and semiconductors. Band structure of conductors, insulators and semiconductors and their applications. Colour in inorganic solids.

Intrinsic and extrinsic semiconductors, doping of semiconductors and conduction mechanism, the band gap, temperature dependence of conductivity, carrier density and carrier mobility in semiconductors, synthesis and purification of semiconducting materials, single crystal growth, zone refining, fractional crystallization, semiconductor devices, rectifier transistors, optical devices, photoconductors, photovoltaic cells, solar batteries.

CL 222 ORGANIC CHEMISTRY- 11

Total 90 h

Unit I Molecular rearrangement and transformation reactions 18 h

Types of organic rearrangements. Anionic, cationotropic, prototropic, free radical, carbene, nitrene and long-range rearrangements. Mechanism with evidence of Wagner-Meerwein, Pinacol, Demjanov, Hofmann, Curtius, Schmidt, Lossen, Beckmann, Wolf, Fries,

Arylazo, Fischer-Hepp, Hofmann-Martius, Von-Richter, Orton, Bamberger, Smiles, Dienone-phenol, Benzilic acid, Benzidine, Favorskii, Stevens, Wittig, Sommelet-Hauser, Bayer-Villiger, Hydroperoxide and borane rearrangements.

Unit II Aromaticity and symmetry controlled reactions 18 h

Aromaticity and antiaromaticity. Homo, hetero and non benzenoid aromatic systems. Aromaticity of annulenes, mesoionic compounds, metallocenes, cyclic carbocations, carbanions and fullerenes. Symmetry properties of MOs. Classification of pericyclic reactions. Mechanism and stereochemistry of electrocyclic, cycloaddition and sigmatropic reactions. Woodward- Hoffmann rules. FO, CD and Huckel-Mobius analysis of electrocyclic and cycloaddition reactions including biological cyclo additions. FO analysis of [I, j] and [3, 3] migrations. 1, 3- dipolar cycloaddition. Stereo aspects of Diels- Alder reaction and Cope re arrangement. Fluxinol molecules. Retro Diels- Alder, ene, cheletropic and cis elimination reactions and synthetic applications.

Unit III Organic photochemistry 18 h

Photochemical processes**.** Energy transfer, sensitization and quenching. Singlet and triplet states and their reactivity. Photoreactions of carbonyl compounds, enes, dienes and arenes. Norrish reactions of acyclic ketones. Free radical reactions. Patterno-Buchi, Barton, photo-Fries and Di-л methane rearrangements. Photoreactions of Vitamin D. Photosynthesis and photochemistry of vision. Singlet oxygen generation and their reactions. Applications of photochemistry.

Unit IV Chemistry of natural products and biomolecules 18 h

Introduction to primary and secondary metabolites in plants. Extraction methods of chemical constituents from plants, such as fractionation using solvents, specific extraction of alkaloids and supercritical fluid extraction. Characterizations of isolated compounds (terpenes, sterols, alkaloids, carbohydrates, flavonoids and poly phenols) by colour reactions and spray reagents. Biosynthesis of terpenes from mevalonic acid and sterols from squalene. Structure elucidation of ocimene monoterpene, classification of pigments, structure elucidation of β –carotene. Structural differences between a triterpene and a sterol. Synthesis of quercetin, synthesis of testosterone, androsterone, estrone and progesterone. Determination of carbon skeleton of alkaloids (Hofmann, Emde and Von Braun degradation methods). Structural elucidation of ephedrine, nicotine , atropine,hygrine.

Unit V Physical organic chemistry 18 h

Reactivity in relation to molecular structure and conformation. Steric effects. F strain. Ortho effect. Bond angle strain. The Hammett equation and its applications. Taft equation. Linear free energy relationships. Solvent polarity and parameters. Y, Z and E parameters and their applications. Primary and secondary kinetic isotope effects. Salt effects and special salt effects in SN reactions. Kinetic and thermodynamic control of reactions. The Hammond postulate. Principle of microscopic reversibility. Marcus theory. Methods of determining reaction mechanisms. Phase transfer catalysis and its applications.

CL 223 PHYSICAL CHEMISTRY -II

Total 90 h

Unit I Chemical Bonding 18 h

Approximate methods: Variation method- Variation theorem and its proof. Linear variation functions. Secular equations and secular determinants.

Perturbation method-Successive correction to an unperturbed problem. Detailed treatment of first order non-degenerate case only. LCAO-MO Theory- MO theory of H_2^+ and H_2. MO treatment of other homo diatomic molecules Li_2, Be_2, B_2, C_2, N_2, O_2 and F_2. MO treatment of hetero diatomic molecules LiH, CO, NO and HF. Spectroscopic term symbols for homo diatomic molecules.

Valance bond theory of H_2. Quantum mechanical treatment of SP, SP^2 and SP^3 Hybridisation.

HMO theory of conjugated π-systems. Bond order and charge density calculations. Free valance. Application of HMO method to ethylene, allyl system, butadiene and benzene.

Secondary bond forces: ion dipole, dipole-dipole, ion-induced dipole, London dispersion forces.

Unit II Spectroscopy –I 18 h

Microwave spectroscopy: Rotational spectrum, Intensity of spectral lines, calculation of inter nuclear distance. Non-rigid rotors and centrifugal distortion. Rotational spectra of polyatomic molecules-linear and symmetric top molecules. Introduction to instrumentation.

Vibrational Spectroscopy: Vibrational spectra of harmonic and anharmonic oscillator. Selection rules. Morse curve, fundamentals and overtones. Determination of force constant. Rotational fine structure, P,Q,R branches of spectra.

Vibrational spectra of polyatomic molecules: Normal modes, classification of vibrational modes into stretching (asymmetric, symmetric), bending, parallel and perpendicular

vibrations. Finger print region and group frequencies. Introduction to FTIR and instrumentation.

Raman spectroscopy: Raman scattering, polarisability and classical theory of Raman spectrum. Rotational and vibrational Raman spectrum. Raman spectra of polyatomic molecules. Complementarity of IR and Raman spectra. Mutual exclusion principle. Introduction to instrumentation. Laser Raman spectrum.

Electronic spectra. Electronic spectra of diatomic molecules. Vibrational coarse structure and rotational fine structure of electronic spectrum. Franck-Condon principle. Types of electronic transitions. Fotrat diagram. Predissociation . Calculation of heat of dissociation.

Electronic spectra of polyatomic molecules: Electronic transition among molecular orbitals and absorption frequencies. Effect of conjugation. Introduction to instrumentation. Simultaneous determination of two components.

Unit III Applications of thermodynamics 18 h

Phase equillibria: Criteria of Equillibrium. Derivation of phase rule Discussion of two component systems forming solid solutions with and without maximum or minimum in freezing point curve. Systems with partially miscible solid phases.

Three component systems : Graphical representation. Three component liquid systems with one pair of partially miscible liquids. Influence of temperature. Systems with two pairs and three pairs of partially miscible liquids. Two salts and water systems. Isothermal evaporation. Transition point and double salt formation.

Thermodynamics of irreversible processes : Simple examples of irreversible processes. General theory of non equilibrium processes. Entropy production from heat flow. Matter flow and current flow. Generalised equation for entropy production. The phenomenological relations. Onsager reciprocal relation, Application of irreversible thermodynamics to diffusion. Thermal diffusion, Thermo osmosis and thermomolecular pressure difference., electro kinetic effects, the Glansdorf- Pregogin equation. Far from equilibrium region. Principle of minimum entropy production. Thermodynamic analysis of stability. Stability criterion and Le-Chatelier Brawn Principle.

Unit IV Statistical mechanics –I 18 h

Mechanical description of molecular systems. Thermodynamic probability and entropy. Microstates. Concept of ensembles Canonical and Grand canonical ensemble. Maxwell Boltzmann distribution.

Quantum statistics: Bose Einstein Statistics , Bose Einstein distribution. Thermodynamic probability, Bose Einstein distribution function. Examples of particles. Theory of Para magnetism. Bose Einstein condensation, Liquid Helium. Supercooled liquid. Fermi- Dirac Statistics. Fermi- Dirac Distribution, Examples of particles Fermi Dirac Distribution function Thermionic emission. Relation between Maxwell Boltzmann, Bose Einstein and Fermi - Dirac Statistics

The Partition functions. Partition function for free linear motion, for free motion in a shared space, for linear harmonic vibration.

Unit V Electrochemistry 18 h

Ionics- Ions in solution. Deviation from ideal behaviour. Ionic activity. Ion-solvent interaction. Born equation. Ion-ion interaction. Activity coefficient and its determination. Debye-Huckel limiting law. Equation for appreciable concentration. Osmotic coefficient. Activities in concentrated solutions. Ion associations. Strong electrolytes. Ion transport. Debye-Huckel treatment. Onsager equation. Limitation of the model. Conductance at high frequencies and high potentials.

Electrodics: Different type of electrodes. Electrochemical cells. Concentration cells and activity coefficient determination. Origin of electrode potential. Liquid junction potential. Evaluation of thermodynamic properties. The electrode double layer. Electrode-electrode interface. Theory of multilayer capacity. Electrocapillarity. Lippmann potential and membrane potential.

Fuel cells- H_2-O_2 fuel cell, fuel cell for high temperature applications.

Electrokinetic phenomena. Mechanism of charge transfer at electrode- electrolyte interface. Electrolysis. Current- potential curve. Dissolution, deposition and decomposition potentials. Energy barriers at metal –electrolyte interface. Different types of overpotentials. Butler-Volmer equation. Tafel and Nernst equation. Rate determining step in electrode kinetics. The hydrogen and oxygen over voltage. Theories of overvoltage.

SEMESTER III

CL 231 INORGANIC CHEMISTRY- III

Total 90 h

Unit I Organometallic compounds 18 h

Nomenclature of organometallic compounds.Types of metal complexes. Metal carbonyls, bonding in metal carbonyls. Application of infrared spectroscopy for the elucidation of metal carbonyl bonding. Bonding in metal nitrosyls and cyanides. Synthesis, structure and bonding in polynuclear carbonyls with and without bridging. Complexes with linear π- donor ligands: Olefins, acetylenes, dienes and allyl complexes. Hapto nomenclature. Complexes with cyclic π donors: Cyclopentadiene, benzene, cycloheptatriene and cyclooctatetraene complexes, structure and bonding. Fluxional molecules. Catalysis by organometallic compounds: Hydrogenation, hydroformylation and polymerization reactions.

Unit II Coordination chemistry-III: Reactions of metal complexes 18 h

Energy profile of a reaction - Thermodynamic and kinetic stability, Classification of ligand substitution reactions -kinetics and mechanism of ligand substitution reactions in square planar complexes, trans effect- theory and synthetic applications.

Kinetics and mechanism of octahedral substitution- water exchange, dissociative and associative mechanisms, base hydrolysis, racemization reactions, solvolytic reactions (acidic and basic)

Electron transfer reactions: Outer sphere mechanism- Marcus theory, inner sphere mechanism- Taube mechanism. Photochemical reactions- substitution and redox reactions of Cr(III) , Ru(II) , and Ru(III) complexes. Photo-isomerisation and photo-aquation reactions of metal complexes.

Unit III Bioinorganic chemistry 18 h

Essential and trace elements in biological systems, structure and functions of biological membranes, mechanism of ion transport across membranes, sodium-potassium

pump. Photosynthesis, porphyrin ring system, chlorophyll, PS I and PS II. Synthetic model for photosynthesis. Role of calcium in biological systems.

Oxygen carriers and oxygen transport proteins- haemoglobin, myoglobin and haemocyanin. Iron storage and transport in biological systems- ferritin and transferrin. Redox metalloenzymes-cytochromes, peroxidases and superoxide dismutase and catalases. Nonredox metalloenzymes- CarboxypeptidaseA- structure and functions. Nitroeenaesesgeases, biological nitrogen fixation. Vitamin B_{12} and coenzymes.

Unit IV Electrical and magnetic properties of solids 18 h

Conductivity of pure metals. Superconductivity. Photoconductivity. Photovoltaic effect, Dielectric properties. Dielectric materials. Ferroelectricity, pyroelectricity, piezoelectricity and ionic conductivity. Applications of ferro, piezo and pyroelectrics.

Magnetic properties of solids: Behaviour of substances in a magnetic field. Diamagnetism, paramagnetism, ferromagnetism, antiferromagnetism and ferrimagnetism. Effect of temperature, Curie and Curie- Weiss laws. Magnetism of ferro and antiferromagnetic ordering. Super exchange. Lasers and their applications.

Unit V Nuclear chemistry 18 h

Nuclear structure, mass and charge. Nuclear moments. Binding energy. Semiempirical mass equation. Stability rules. Magic numbers. Nuclear models: Shell, Liquid drop, Fermi gas, collective and optical models. Equation of radioactive decay and growth. Half life and average life. Radioactive equilibrium. Transient and secular equilibria. Nuclear reactions. Introduction, production of projectiles, nuclear reaction cross section, nuclear dynamics, threshold energy of nuclear reaction, Coulomb scattering, potential barrier, potential well, formation of a compound nucleus. Nuclear reactions: Direct nuclear reactions, heavy ion induced nuclear reactions, photonuclear reactions.

Neutron capture cross section and critical size. Nuclear fission as a source of energy, Nuclear chain reacting systems. Principle of working of the reactors of nuclear power plants. Breeder reactor. Nuclear fusion reaction, stellar energy. Detection and measurement of radiation.

CL 232 ORGANIC CHEMISTRY-111

Total 90 h

Unit 1 UV-VIS, IR and Mass spectroscopy 18 h

Electronic transitions and analysis of UV spectra of enes, enones and arenes. Woodward-Fieser rules. Effect of solvent polarity on UV absorption. Principle of characteristic group frequency in IR. Identification of functional groups and other structural features by IR, Hydrogen bonding and IR bands. Sampling techniques. FTIR and its instrumentation. Organic mass spectroscopy. EI, CI, FAB, Electrospray and MALDI ion sources. Magnetic, High resolution (Double focusing), TOF and quadruple mass analysers. Characteristic EIMS fragmentation modes and MS rearrangements. Mass spectral fragmentation patterns of long chain alkanes, alkenes, alkynes, carbonyl , nitro, amino and carboxy compounds. Strategies for the analysis of mass spectra..

Unit II NMR spectroscopy and structure elucidation 18 h

Theory of NMR spectroscopy, chemical shifts, anisotropic effects and coupling constant. Spin-spin interactions in typical systems. First order and second order spectra. Simplification methods of complex spectra by high field NMR, shift reagents, chemical exchange and doule resonance. Theories of FT NMR (1D NMR), 2D NMR and ^{13}C NMR spectroscopies. ^{13}C NMR chemical shifts. Instrumentation of NMR. Applications of NOE, APT, DEPT, INEPT and 2-DNMR and INADEQUATE, HOHA spectroscopies. Introduction to 3D NMR. Spectral interpretations and structure identification. Spectral interpretation using actual spectra taken from standard texts. Solving of structural problems on the basis of numerical and spectrum based data.

Unit III Molecular recognition and supramolecular chemistry 18 h

Introduction to supramolecular chemistry. One-pot reactions.The concepts of molecular recognition, host, guest and receptor systems. Forces involved in molecular recognition. Hydrogen bonding, ionic bonding, π-stacking, Vander Walls and hydrophobic interactions. Introduction to molecular receptors. Tweezers, cryptands and carcerands. Cycophanes, cyclodextrins and calixarenes- typical examples. Non-covalent interactions in biopolymer structure organization. Role of self organization and self association in living nature.

Importance of molecular recognition in DNA and protein structure, their function and protein biosynthesis. Supramolecular systems like Organic zeolite, Clathrate hydrates of gases, Helicates. Nanotubes, liquid crystals, nanotechnology and other industrial applications of supramolecular chemistry.

Unit IV Medicinal chemistry 18 h

Retrosynthetic analysis and disconnection approach. Synthetic strategy and synthons **,**

Combinatorial organic synthesis, introduction, methodology, automation, solid supported and solution phase synthesis, study of targeted or focused libraries and small molecule libraries, Applicaion- drug discovery.

Drug design and development-Discovery of a drug, a lead compound. Development of drug-Pharmaccophore identification, modification of structure, structure-activity relationship, structure modification to increase potency. The Hammet equation, Taft equation and lipophilicity. Computer assisted drug design. Receptors and drug action. Natural products and drug development. Different classes of drugs with examples. Synthesis of paracetamol, phenobarbital, diazepam, sulphamethoxazole, benzyl penicillin, chloramphenicol.

Unit V Green chemistry 18 h

Twelve principles of green chemistry. Green chemical strategies for sustainable development- Reaction mass balance, atom economy evaluation for chemical reaction efficiency, green solvents, reaction media- Synthesis under water, solventless, fluorous and ionic liquid media. Synthesis using scavenger resins, catalysis and biocatalysis. Green computation. Green processes-. Microwave synthesis- fundamentals of microwave synthesis-Two Principal Mechanisms for Interaction With Matter- The Microwave Effect with examples - Single-Mode and Multimode Microwave cavities. Microwave technology-Techniques and applications in MORE chemistry. Sonochemical synthesis. Applications of sonication in the synthests of organic compounds.

CL 233 Physical Chemistry -III

Total 90 h

Unit I Computational c hemistry. 18 h

Introduction to computational chemistry, concept of potential energy surface(PES), stationary point, saddle point and geometry optimisation.

Basis sets, STO, Gaussian functions and its properties, GTO, contracted Gaussians, minimal , split valance, polarised and diffused basis sets.

Introduction to SCF. Wave function for open shell state, RHF, ROHF and URHF. Model Chemistry. Brief description of computational methods- ab-initio, semiempirical and density functional and molecular mechanics methods. Construction of Z-matrix for simple molecules- H_2O, H_2O_2, H_2CO, CH_3CHO, NH_3, and CO_2.

Unit II Spectroscopy II 18 h

Resonance spectroscopy: Nuclear Magnetic resonance Spectroscopy, Nuclear spin. Interaction between nuclear spin and applied magnetic field. Proton NMR . Population of energy levels. Nuclear resonance. Chemical shift. Relaxation methods. Spin-spin coupling. Fine structure. Elementary idea of 2D and 3D NMR. Introduction to instrumentation.

ESR spectroscopy: Electron spin. Interaction with magnetic field. Kramer's rule. The g factor. Determination of g values. Fine structure and hyperfine structure. Elementary idea of ENDOR and ELDOR.

Mossbauer spectroscopy: Basic principles. Doppler effect, chemical shift, recording of spectrum, application. Quadrupole effect. Principle and application of NQR spectroscopy.

Photoelectron spectroscopy. Introduction to UV photoelectron and X-ray photoelectron spectroscopy.

Unit III Statistical mechanics II 18 h

Complex partition functions and partition function for particles in different force fields. Langevin's partition function and its use for the determination of dipole moment. Electrostatic energies. Molecular partition functions. Translational, vibrational, rotational and electronic partition functions. Total partition functions , partition functions and

thermodynamic properties. The principle of equipartition of energy. Chemical equilibrium. Law of mass action. Transformation of the equilibrium expressions. Statistical derivation.

Real gases, intermolecular potential and virial coefficients. Equipartition principle and Quantum theory of heat capacity. Calculation of heat capacity of gases, limitation of the method. Heat capacity of solids. Dulong and Petit's law, Kopp's law, Classical theory and its limitation. The vibrational properties of solids. Einstein theory of heat capacity. The spectrum of normal modes. Limitations of Einstein's theory. The Debye theory, the electronic specific heat. Structure and thermal properties of liquids. Pair correlation functions.

Unit IV Surface chemistry and catalysis 18 h

Different types of surfaces. Properties of surface phase. Thermodynamics of surface. Surface tension of solutions. Gibb's adsorption equation and its verification. Surfactants and miscelles Examination of surfaces using low energy electron diffraction, photoelectron spectroscopy, ESCA, scanning probe microscopy, Auger electron spectroscopy , SEM and TEM.

Surface films: different types, Surface pressure and Surface potential, and their measurements and interpretation.

The Gas- solid inter phase. Types of adsorption. Heat of adsorption, The Langmuir theory- kinetic and statistical derivation. Multilayer adsorption- the BET theory and Harkins- Jura theory. Adsorption from solutions on solids. Langmuir and classical isotherms. Chemisorption-. differences with physical adsorption. Adsorption isotherms, adsorption with dissociation. Adsorption with interaction between adsorbate molecules.

Measurement of surface area of solids: Harkins – Jura absolute method, entropy method and the point B method. Use of Langmuir, BET and Harkins – Jura isotherms for surface area determination.

Catalysis: Mechanism and theories of homogeneous and heterogeneous catalysis. Enzyme catalysis, Bimolecular surface reactions. Langmuir – Hinshelwood mechanism

Instrumental methods of catalyst characterization- diffraction and thermal methods, spectroscopic and microscopic techniques.

Unit V Electro Analytical and spectrophotometric methods. 18 h

Potentiometric methods: Reference electrodes and indicator electrodes. The hydrogen, calomel, Ag-AgCl electrode. The glass electrode- its structure, performance and limitations. Measurement of pH. Potentiometric titrations- redox and precipitation titrations. Electrogravimetry: Principle and method. Determination of Copper. Separation of metals. Conductometry: principle and method. Conductometric titrations. Coulometry: Principle and method. Coulometric titrations. principle and method of polarography, Voltametry, cyclicvoltammetry, stripping voltammetry and amperometry.

Flame emission and atomic absorption spectrometry. Instrumentation for AAS. The flame characteristics. Atomiser used in spectroscopy. Hollow cathode lamp. Interference in AAS. Application of AAS.

CL 234 Inorganic Chemistry Practicals -II Total-125 h

1. Estimation of simple mixture of ions (involving quantitative separation) by volumetric and Gravimetric methods.
2. Analysis of typical alloys and ores
3. Ion exchange separation of binary mixtures.
4. Spectral Interpretation of metal complexes using IR, UV-Vis. spectral data. Supplementary information like metal estimation, CHN analysis, conductivity measurements and magnetic measurements to be provided to the students. Assessment is based on arriving at the structure of the complex and assignment of IR spectral bands.
5. Interpretation of TG and DTA curves of metal oxalates/acetates/sulphates/chlorides in hydrated forms. Assessment is based on the identification of various stages.

CL 235 ORGANIC PRACTICALS-II

Total 125 h

A.**Volumetric estimation** of

1) Aniline 2) Phenol 3) glucose

4) Iodine value and saponification value of coconut oil

B). **Colorimetric estimation** of 1) Aniline 2) Glucose 3) Cholesterol 4) Ascorbic acid 5) Streptomycin or Aspirin.

C). Spectral identification (UV, IR, ^{1}H NMR, ^{13}C NMR, EI mass) of Organic compounds from a library of organic compounds

D. Separations of mixtures by Paper Chromatography

1) Separation of amino acids 2) Separation of dyes

E) Three stage preparation

1)Benzaldehyd**e** ⟶ Benzoin(green synthesis with thiamine HCl) ⟶ benzil

→ benzilic acid

2) Phthalic acid → Phthalic anhydride → pthalimide → anthranilic acid

CL 236 PHYSICAL PRACTICALS –II **Total 125 h**

1. Conductometry

Determination of strength of strong and weak acids in a mixture

Determination of strength of a weak acid.

Determination of solubility product of a sparingly soluble salt ($PbSO_4$, $BaSO_4$ etc.)

Hydrolysis of NH_4Cl or CH_3COONa or aniline hydrochloride

Determination of order of reaction, rate constant and energy of activation for saponification of ethyl acetate

Precipitation titrations.

Determination of critical micellar concentration (CMC) of sodium lauryl sulphate from

measurement of conductivities at different concentrations.

Equivalent conductance at infinite dilutions and verification of Kohlraush's Law.

Determination of Onsager constants.

2. Potentiometry

Determination of emf of Daniel cell.

Determination of the emf of various $ZnSO_4$ solutions and hence the concentration of unknown $ZnSO_4$ solution.

Determination of valency of mercurous ion.

Determination of temperature dependence of EMF of a cell

Determination of stoichiometry and formation constant of silver-ammonia complex.

Determination of activity and activity constant of electrolytes.

Determination of thermodynamic constants of reactions.

pH metric titrations.

Acid alkali titrations using Quinhydrone electrode.

Titrations(double) involving redox reactions – Fe^{2+} Vs $KMnO_4$, $K_2Cr_2O_7$, $Ce(NH_3)SO_4$ and KI Vs $KMnO_4$

Determination of strengths of halides in a mixture.

Determination of pH of buffer solutions and hence to calculate the E_0 of quinhydrone electrode

3. Spectrophotometry

Verification of Beer-Lambert's law.

Absorption spectra of conjugated dyes.

Determination of concentration of potassium dichromate and potassium permanganate in a mixture.

To study the complex formation between Fe^{3+} and salicylic acid.

Determination of pKa of an indicator.

4. Polarimetry

Measurement specific rotation of glucose.

Determination of specific rotation of sucrose

Determination of unknown concentration of glucose solution.

and rate constant of its hydrolysis in presence of HCl

Polarography :

Determination of half wave potential E ½ and unknown concentration of Cd^{2+} ion.

Determination of concentrations of metal ions in a mixture.

5. Surface tension

Determination of surface tension of various liquids by Stalagmometric method (drop number / drop weight)

Determination of parchors of molecules and various groups.

Determination of concentration of a mixture.

Determination of surface tension and parachor of liquids using double capillary method.

6. Refractometry

Determination of molar refraction of pure liquids

Determination of concentration of KCl solution/glycerol solution

Determination of solubility of KCl in water.

Determination of molar refraction of solid KCl

Study the stoichiometry of potassium iodide-mercuric iodide complex.

Determination of concentration of KI solution.

7. Viscosity

Determination of viscosity of various liquids using Ostwald,s viscometer.

Determination of unknown composition of given liquid mixture like toluene-nitrobenzene.

Verification of Kendall's relation.

Verification of Jon Dole's equation.

SEMESTER IV

Total 90 h

CL 241 APLLIED ANALYTICAL CHEMISTRY

Unit I Water and wastewater analysis 18 h

Physical examination of water; Colour. Conductivity. Temperature. Odour. Turbidity. Hardness. Chemical examination of water; Calcium. Magnesium. Sodium. Potassium. Chlorine. Sulphate. Carbonates and Bicarbonates. Dissolved Solids. Minor Components of water; Fluoride. Nitrogen Ammonia, Nitrite and Nitrate.iron. Manganese. Silica. Alkalinity/Acidity or pH

Biological investigation of water; Dissolved oxygen of water. Biochemical oxygen demand. Bacteriological examination of water. Wastewater analysis; Quality of industrial effluent, effluent from chemical processes. Waste water from Food, Beverages and Drug Industry. Waste water from textile, energy and power related industry. Physical methods of characterization. Analysis of organic pollutants, Total organic carbon, Analysis of metal and radioactive pollutants in effluents.

Unit II Soil analysis 18 h

Organic matter in soil: Determination of Soil Organic Carbon Concentrations, Non humic substances: Carbohydrates, Nitrigen, Sulfur and phosphorus compounds. Lipids. Lignins. Humic substances. Chemical and structural characteristics of Humic substances. Functional groups and Structural components. Surface functional groups and complexes.

Oxidation Reduction reactions in Soils: The electron activity. Redox potential measurements. Redox status in soils. Reduction oxidation Sequences in soils. Redox zones. Pe-pH Predominance diagrams: Construction of pe pH diagrams. Examples of pe pH diagrams for redox sensitive elements. Iron and Manganese. Selenium. Arsenic. Acidity in Soils Materials: The measurement of Soil Solution pH. The pH electrode system.The soil solution pH. Chemical and Biochemical processes that influences Soil Solution pH.

Unit III Air pollution analysis 18 h

Structure of atmosphere, Sources of air pollution. Effects of air pollution on man and materials. Classification of air pollutants, sampling methods of gaseous pollutants. Analysis of aerosols and gaseous pollutants. Analysis of NO NOx, SO_2, H_2S, Ozone, CO CO_2 and NH_3. Air pollution monitoring instruments and monitoring programmes.

Unit IV Food and forensic analyses : 18 h

Moister, ash, crude protein, fat, crud fiber, carbohydrate, calcium, potassium, sodium,

and phosphates, food adulteration – common adulteration in food, contamination of food

stuffs, microscopic examination of foods for adulterants, Pesticide analysis in food

products. Special features of Forensic analysis, sampling, sample storage, sample dissolution, classification of poisons, Lethal dose, significance of LD 50 and LC 50. Identification and Analysis in the suspects: Poisonous elements viz As, Sb, Pb, Cr and Hg. Insecticides Analysis of metals, Gun powder Residues, portland cement in Forensic samples. Poisoning due to cyanide, dioxines & asbestos. Physiological effects of natural poisons such as Col Chicine, Morphine, Hashish , Nicotinoids. Health hazards and Remedial measures.

Unit V Analysis of selected materials 18 h

Principles of estimation of biological fluids. Estimation of hemoglobin, cholesterol and blood sugar (clinical and enzyme assays). Analysis of milk products: Theory of the analysis of milk, butter and other diary items. Analysis of fats and oils. Characterization of fats and oils. Iodine value, iodine bromine value and saponification value, and their significances. Analysis of drugs and pharmaceuticals: Quality control. Official methods. Classical and modern methods of drug analysis . Analysis of Alcoholic Beverages. Determination of quality parameters such as original extract, alcohol, extract, CO_2, O_2, Brix, degree of inversion, pH value, ethyl carbamate, carbohydrate, and dissolved oxygen

CL 242 DISSERTATION

Each of the students has to carry out original research in a topic in accordance with the Elective paper chosen for Semester IV under the guidance and supervision of a teacher in the concerned Department of the College.

Instructions to Question Papers Setters

The Syllabus of each theory has five units. While setting the question papers, equal weight is to be given to each of the Units for choosing the questions. Each question paper is of 3 hours duration and has three Sections, namely Section A, Section B and Section C constituting a total 75 marks as detailed.

Section A Five questions, one from each Unit containing three short answer questions marked (a), (b), and (c), each of which has 2 marks. One has to answer any two of (a), (b) or (c) from each of the five questions. (2x10=20 marks)

Section B Five questions, one from each Unit containing two short essay questions marked (a) and (b), each of which has marks. One has to answer either (a) or (b) from each of the five questions. (5x5=25 marks)

Section C Five essay questions, one from each unit having 10 marks. One has to answer any three questions from the five questions asked. (1x3=30 marks).

M.Sc. PROGRAMME IN BRANCH V – APPLIED CHEMISTRY

(Revised syllabus under semester system with effect from 2013 admission)

SYLLABUS AND SCHEME OF EXAMINATION

Course No. and Title	Hours per week		Duration of ESA in hours	Marks for CA	Marks for ESA	Total marks
	L	P				
SEMESTER I*						
CA 211 Inorganic Chemistry I	5		3	25	75	100
CA 212 Organic Chemistry I	5		3	25	75	100
CA 213 Physical Chemistry I	5		3	25	75	100
CA 214 Inorganic Practicals I		3	(To be continued in Semester II)			
CA 215 Organic Practicals I		3	(To be continued in Semester II)			
CA 216 Physical Practicals I		4	(To be continued in Semester II)			
			Total marks for semester 1			300
*Distribution of teaching hours/week: Theory- 15 hours, Practicals- 10 hours (1 hour for Seminar)						
SEMESTER II*						
CA 221 Inorganic Chemistry II	5		3	25	75	100
CA 222 Organic Chemistry II	5		3	25	75	100
CA 223 Physical Chemistry II	5		3	25	75	100
CA 214 Inorganic Practicals I		3	6	25	75	100
CA 215 Organic Practicals I		3	6	25	75	100
CA 216 Physical Practicals I		4	6	25	75	100
	Total marks for Semester II					600
*Distribution of teaching hours/week: Theory- 15 hours, Practicals- 10 hours (1 hour for Seminar)						

SEMESTER III*						
CA 231 Inorganic Chemistry III	5		3	25	75	100
CA 232 Organic Chemistry III	5		3	25	75	100
CA 233 Physical Chemistry III	5		3	25	75	100
CA 234 Inorganic Practicals II		3	(To be continued in Semester IV)			
CA 235 Organic Practicals II		3	(To be continued in Semester IV)			
CA 236 Physical Practicals II		4	(To be continued in Semester IV)			
			Total marks for semester III			300
*Distribution of teaching hours/week: Theory- 15 hours, Practicals- 10 hours (1 hour for Seminar)						
SEMESTER IV*						
CA 241 Applied chemistry	15		3	25	75	100
CA 234 Inorganic Practicals II		3	6	25	75	100
CA 235 Organic Practicals II		3	6	25	75	100
CA 236 Physical Practicals II		4	6	25	75	100
CA 242(a) Dissertation					90	90
CA 242(b) Visit to R & D Centre					10	10
Comprehensive viva-voce					100	100
	Total marks for Semester IV					600
	Grand total (for semesters I-IV)					1800
*****Distribution of teaching hours/week: Theory- 15 hours, 10 hours for discussion on project (1 hour for Seminar)						

M.Sc. PROGRAMME IN BRANCH V – APPLIED CHEMISTRY

(Revised syllabus under Semester System w.e.f. 2013 Admission)

SEMESTER I

CA 211 INORGANIC CHEMISTRY - I

Total 90 h

Unit I Noble gases, halogens, isopoly and heteropoly acids 18 h

Noble gas compounds: Preparation, properties, structure and bonding. Halogens in positive oxidation states. Preparation, properties, structure, bonding and uses of inter halogen compounds, pseudo halogens, poly halide ions. Astatine: Synthesis, stability and properties.

Preparation, properties and structure of isopoly and heteropoly acids of Mo and W. Classification, preparation, properties and structure of borides, carbides, nitrides and silicides. Classification and structure of silicates. Properties and structure of aluminosilicates and zeolites. Preparation, properties and applications of silicones.

Unit II Coordination chemistry-I: Theories of metal complexes 18 h

Types of ligands and complexes. Isomerism: Geometrical, optical and structural isomerism. Stability of complex ions in aqueous solutions: Formation constants. Stepwise and overall formation constants. Factors affecting stability of complexes. Trends in stepwise constants. Determination of stability constants: spectrophotometric, polarographic and potentiometric methods. Stability of chelates. Thermodynamic explanation, macrocyclic effects.

Crystal field theory: Splitting of d orbitals in octahedral, tetragonal, square planar, tetrahedral, trigonal bipyramidal and square pyramidal fields. Jahn-Teller theorem, dynamic-static -evidence for JT effect. Crystal field stabilization energy (CFSE) and its calculations. Octahedral Site Stabilization Energy. Thermodynamic effects of CFSE. Factors affecting the splitting parameter. Spectrochemical series. Ligand field theory. Molecular orbital theory. Sigma and pi bondings in complexes. MO diagrams of octahedral complexes with and without pi bonds. Effect of pi bond on the stability of sigma bond. Nephelauxetic effect. Critical comparison of the three theories.

Unit III Analytical principles **18 h**

Evaluation of analytical data: Accuracy and precision. Standard deviation, variance and coefficient of variation. Student 't' test. Confidence limits. Estimation of detection limits. Errors: Classification, distribution, propagation, causes and minimization of errors. Significant figures and computation rules. Correlation analysis: Scatter diagram. Correlation coefficient, r. Calculation of r by the method of least squares.

Volumetric methods: Classification of reactions in volumetry. Theories of indicators. Acid-base, redox, adsorption, metallochromic, fluorescent and chemiluminescent indicators. Complexation titrations: Titration using EDTA. Precipitation titrations. Redox titrations. Gravimetric methods: Mechanism of precipitate formation. Aging of precipitates. Precipitation from homogeneous solutions. Coprecipitation and postprecipitation. Contamination of precipitates. Washing, drying and ignition of precipitates. Organic reagents used in gravimetry: Oxine, dimethylglyoxime and cupferron.

Unit IV Nanomaterials **18 h**

General introduction to nanomaterials and emergence of nanotechnology, Moore's law, synthesis and properties of fullerenes and carbon nanotubes, synthesis of nanoparticles of gold, silver, rhodium, palladium and platinum. Techniques of synthesis- electroplating and electrophoretic deposition, conversion through chemical reactions and lithography. Thin films- chemical vapour deposition and atomic layer deposition techniques.

Elementary idea of characterization of nanomaterials using XRD powder, TEM, AFM, SEM and STM techniques.

Diversity in nanosystems: self assembled monolayers on gold-growth process and phase transitions. Gas phase clusters- formation, detection and analysis. Quantum dots- preparation, characterization and applications.

Unit V Chemistry of natural environmental processes **18 h**.

The chemistry of processes in atmosphere: Composition of the atmosphere: Automobile pollutants and the catalytic converter. Photochemical smog. Chemistry of the stratosphere. Catalytic destruction of ozone. Depletion of the protective ozone layer. Effects of air pollutants on the human health.

The Chemistry of processes in hydrosphere: The hydrologic cycle. Cycling and purification. The unique properties of water. Acid base properties. CO_2 in water. Alkalinity. O_2 consuming waste.

The chemistry of processes in Lithosphere: Redox status in soil. pE pH predominance diagrams for redox sensitive elements. Acidity in soil materials.Acid neutralization capacity and the quantification of the soil acidity. Ion speciation in soil solution. Quantitative aspects of ion speciation. Cation exchange capacity and exchange phase composition.

CA 212 ORGANIC CHEMISTRY - I

Total 90 h

Unit I Stereochemistry of organic compounds 18 h

Nomenclature of organic compounds, Fused polycyclic hydrocarbons, Bridged polycyclic hydrocarbons, Bridged fused systems, Spirocyclic hydrocarbon systems, Heterocyclic systems,Metal organic compounds.

Molecular chirality, stereochemical nomenclature, prostereoisomerism, stereotopicity and stereoprojections. Non-carbon chiral centres. Introduction to ORD, CD configuration and their application in assigning configuration and conformation. Octant and axial haloketone rules. Cotton effect. Stereochemistry of nitrogen and phosphorus containing compounds. Atropisomerism and its designation. Stereoselectivity, enantiomeric excess and chiral separation methods. Conformational analysis of alkanes, cycloalkanes and biased systems. Effect of conformation on reactivity of cyclohexane and decalin derivatives. Chiral drugs.

Unit II Structure, reactivity and intermediates 18 h

Electronic and steric effects. Influence of structural features on acidity, basicity and reactivity of organic compounds. Structure, formation and properties of carbens, nitrenes and arynes. Singlet and triplet carbenes, formation and reactions. Carbon radicals: Structure, formation and stability. Radical reactions, autoxidation and radical chain reactions. Structure, stability and formation of carbocations, carbanions. Arynes: Formation and structure. S_N1, S_NAr, benzyne and $S_{NR}1$ mechanism in aromatic nucleophilic substitution.Orientation effects of substituents in aromatic electrophilic substitutions.

Unit III. Substitution and elimination reactions 18 h

Nucleophilic susbstitution at sp^3carbon, its mechanisms and stereochemical aspects. Effect of solvent, leaving group and substrate structure. S_N^1 , S_N^2, S_N1^1, S_N2^1, S_Ni reactions. Neighbouring group participation. Non-classical carbocations. Elimination reactions leading to C=C ond formation and their mechanisms. E1, E2 and E1CB mechanisms. Stereoaspects

of C=C bond formation. Effect of leaving group and substrate structure. Hoffmann and Saytzeff elimination. Cis elimination. Competition between S_N^1 and S_N^2, E1and E2, Alkyl halides as survival compounds

Unit IV Reactivity of unsaturated systems 18 h

Stereoaspects of the addition of X_2, HX, boranes and hydroxylation to C=C systems**.** Effect of substituents on the rate of additions. Cis and trans hydroxylation of cycloalkenes. Nucleophilic addition to activated C=C systems. Michael addition. Mechanism, with evidence of Aldol (normal, crossed and directed), Perkin, Stobbe, Knovenagel, Darzen, Reformatsky and benzoin condensations. Grignard, Cannizaro, Wittig and Wittig-Horner reactions. Mechanism and stereochemistry of addition to C=O systems. Cram's rule, Felkin-Anh model, Mechanism of esterification and ester hydrolysis. Structure of the transition state in the addition reactions.

Unit V Separation techniques 18 h

Classification of chromatographic methods. Theory of chromatography. Applications of chromatographic methods. Adsorption and partition chromatography. Paper, thin layer and column chromatographic methods. Centrifugal TLC, LC, Pressure column chromatography, HPLC and GC. Column matrices. Detectors. Affinity and chiral separations using HPLC. Normal and ultra centrifugation. Gel and Capillary electrophoresis and their applications. Solvent extraction. Extraction using supercritical liquid CO_2, Craig's technique of iquid liquid extraction.

CA 213 PHYSICAL CHEMISTRY -I

Total 90 h

Unit I Quantum mechanics 18 h

Experimental foundation of quantum mechanics- The black body radiation, Compton effect, photoelectric effect, atomic spectra. Failure of classical mechanics, need of quantum mechanics. Concept of matter wave, de Broglie relation and its experimental proof, Uncertainty principle and its consequences.

The postulates of quantum mechanics: Wave function postulate- wave function and its physical meaning, well behaved functions, boundary conditions, orthogonality and orthonormality. Operator postulate- Laplacian and linear operators. Angular momentum operators and commutators. Hamiltonian operator and its properties. Eigen value postulate- eigen value equations and eigen functions. Expectation value postulate. Postulate of time-dependent Shrodinger equation.

Application to simple systems: Solution of Schrodinger wave equation for a free particle, particle on a ring, particle in 1D box, particle in 3D box, separation of variables, degeneracy.

One dimensional Harmonic oscillator- Complete solution. Hermite polynomials, recursion formula, features of the wave functions.

Hydrogen like systems- wave equation in polar coordinate. Separation of variables. R, theta and phi equations. Solution of phi equation. Wave functions of hydrogen like systems. Orbital and radial functions. Radial distribution functions, angular functions and their plots.

Stern-Gerlach experiment. The postulate of spin. Spin orbitals. Many electron atoms. Qualitative idea of self consistant field method. The exclusion principle. Vector atom model. Spin-orbit coupling. Term symbols and explanation of spectral lines.

Unit II Molecular symmetry **18 h**

Symmetry and Character table: Symmetry elements and symmetry operation. Matrix representation of symmetry operations. Character of a matrix. Conditions for a set of elements to form a group. Point groups. Multiplication of operations. Group multiplication table. Similarity transformation and classification of symmetry operation, Matrix representation of point group. Reducible and Irreducible representations. The Great Orthogonality theorem. Rules derived from GOT (proof not required). Setting up of character table of C_{2v}, C_{3v} and C_{2h} groups. Direct product representations.

Reduction formula, reduction of reducible representation to IRs. Transformation properties of atomic orbitals. Hybridisation: identification of atomic orbitals taking part in hybridisation of triangular planar, square planar, triagonal bipyramidal, square pyramidal and tetrahedral molecules. Molecular symmetry and optical activity.

Unit III Basics of chemical thermodynamics . **18 h**

First and second laws of Thermodynamics. Concept of entropy, Free energy. Criteria of Spontaneity and equilibrium. Fundamental equations for open system. Euler's relation. Maxwell relations. Thermodynamic equations of state. Third law of Thermodynamics. Apparent exceptions to the third law. Applications of third law.

Properties of mixtures: Thermodynamics of ideal and non ideal solutions. Partial molar quantities, Chemical potential. Duhem- Margules equation. , Konowaloff's law, Excess thermodynamic functions. Determination of Partial molar properties.

Fugacity and Activity: Fugacity of gases, its determination. Variation of Fugacity with temperature and Pressure. Fugacity of liquids and solids. Fugacity of mixtures of gases. Lewis Randall rule. Fugacity in liquid mixtures. Activity and Activity coefficients. Determination of activity and activity coefficients of electrolytes and non electrolytes.

Reaction Isotherm and spontaneity of reaction. Variation of Equilibrium constant with temperature and pressure. Variation of standard free energy with temperature. Simultaneous equillibria and addition of free energies. Standard free energy of formation and its determination, Free energy functions.

Unit IV Chemical kinetics 18 h

Complex reactions, Reversible, Consecutive, Concurrent and branching reactions. Free radical and chain reactions. Steady state treatment. Reactions like H_2-Cl_2, H_2-Br_2, and decompositions of ethane , acetaldehyde and N_2O_5. Rice-Herzfeld mechanism, Potential energy surfaces-adiabatic and non adiabatic curve crossing processes. Unimolecular reaction. Lindemann treatment. Semenoff-Hinshelwood mechanism of chain reactions and explosion.

Kinetics of fast reactions: Relaxation method, relaxation spectrometry, flow method, shock method, fast mixing method, field jump method, pulse method Flash photolysis and NMR method.

Theories of Reaction rate : Arrhenius equation and its limitations, activation energy , Collision theory and absolute reaction rate theory. Free energy of activation and volume of activation. Thermodynamic formulation of reaction rate. Effects of pressure and volume on the velocity of gas reaction.

Reactions in solution: Comparison between reactions in gas phase and in solution. Factors determining reaction rates in solution. Reaction between ions and influence of ionic strength. Primary and secondary kinetic salt effects. Influence of solvent on reaction rate. Significance of volume of activation. Hammet and Taft equation.

Photochemistry: Effect of radiation on the rate of reaction. Laws of photochemistry. Quantum yield. Photo chemical reactions of H_2-Cl_2, H_2-Br_2.

Unit V Gases, liquids and liquid crystals 18 h

Random movement of molecules: Brownian movement and determination of Avogadro number. The distribution of molecular velocities. Derivation and discussion on Maxwell's equation. Derivation of average and most probable velocities from Maxwell's equation. Influence of temperature on molecular velocities . Molecular collision and mean free path. Homogenous and heterogeneous collisions. Collision of molecules with surface and effusion. Effect of molecular interactions on collision. Transport properties: Viscosity, thermal conductivity and diffusion. Determination of viscosity of gases. Influence of temperature and pressure on transport properties.

Liquid state: X-ray diffraction study of simple liquids and their structure. Oscillator theory of liquid state. Specific heat of liquids.

Liquid crystals: Mesomorphic state, types, examples and applications of liquid crystals. Theory of liquid crystals.

CA 214 INORGANIC CHEMISTRY PRACTICALS -1

Total 125 h

1. Separation and identification of rare/less familiar cations such as Ti, W, Mo, Th, Zr, V, U and Li
2. Volumetric estimation using EDTA, ammonium vanadate, ceric sulphate etc.
3. Colorimetric/spectrophotomteric estimation of Cr, Fe, Mn, Ni, Cu etc.

4. Preparation of metal complexes: selection can be made from the following or any other from the existing literature.

   iii) $[Co(NH_3)_6]Cl_3$, (ii). $[Cu(NH_3)4]SO_4$ (iii) $K_3[Cr(C_2O_4)_3]$

   iv). $K_3[Fe(C_2O_4)_3]$, v). Cis and trans isomers of $[Co(en)_2Cl_2]Cl$

   iv). $[Cr(en)_3]Cl_3$

CA 215 ORGANIC PRACTICALS-1

Total 125 h

A . Separation and identification of organic compounds

1. Quantitative wet chemistry separation of a mixture of two components by solvent extraction

2. Purification of the separated samples by boiling and crystallization.

3. TLC of the purified samples along with the mixture in same TLC plates (if not possible use separate plates) and calculation of R_f values.

B. Separation of a mixture of by column chromatography

1) Malachite green and methylene blue 2) O-nitroaniline and p-nitroaniline.

C. Preparation of compounds by two stages.

TLC analysis of the products and original compound in the same plate and measurement of Rf values. Recording UV, IR, NMR and mass spectrum of synthesized compounds.

1) Acetanilide- ⟶ p-nitroacetanilide ⟶ p-nitroaniline

2) Methylbenzoate ⟶ m-nitromethylbenzoate ⟶ m-nitrobenzoic acid

3) Acetanilide- ⟶ p-bromoacetanilide ⟶ p-bromooaniline

E. Green Organic Chemistry experiments

1) Acetanilide- ⟶ p-bromoacetanilide (KBr and CAN)

2) Benzophenone ⟶ Benzopinacol (photoreduction)

CA 216 PHYSICAL PRACTICALS –I

Total 125 h

1. Adsorption

Freundlich and Langmuir isotherms for adsorption of acetic/oxalic acid on active charcoal.

Determination of concentration of acetic/ oxalic acid.

2. Kinetics

Determination of rate constant of acid hydrolysis of methyl acetate.

Determination of Arrhenius parameters.

Determination of concentration of given acid.

Determination of rate constant of the saponification of ethyl acetate and evaluation of Arrhenius parameters.

Determination of rate constant of reaction between $K_2S_2O_8$ and KI.

Study the kinetics of iodination of acetone in acid medium.

3. Phase rule

Solid-liquid equilibria – Construction of phase diagram and determination of the composition of unknown mixture (naphthalene/biphenyl, naphthalene/benzophenone, naphthalene/diphenyl amine)

Construction of phase diagram with congruent melting point- naphthalene/meta-dinitrobenzene

Partially miscible liquid pairs- CST of phenol-water system.

Effect of impurities (KCl/ NaCl/ succinic acid) on the miscibility temperature of phenol-water system and hence the concentration of given unknown solution.

Three component system- Construction of ternary phase diagram of acetic acid-chloroform-water system and hence the composition of given homogeneous mixture.

Construction of tie-line.

4. Distribution law

Distribution coefficient of iodine between CCl_4 and water

Distribution coefficient of benzoic acid between toluene and water.

Determination of the equilibrium constant of the reaction $KI+I_2 \rightarrow [KI_3]$ and hence the concentration of given KI.

Distribution coefficient of ammonia between chloroform and water.

Determination of equilibrium constant of copper- ammonia complex by partition method or coordination number of Cu^{2+} in copper-ammonia complex.

Determination of hydrolysis constant of anilinium hydrochloride.

5. Dilute Solutions

Determination of K_f of solid solvent, molar mass of non-volatile solute, mass of solvent and composition of given solution (Solvent- Naphthalene/Biphenyl/ Benzophenone etc. Solute- Naphthalene/ Biphenyl/ Diphenylanmine etc)

Determination of vant Hoff's factor for benzoic acid in Naphthalene.

Determination of atomicity of sulphur.

6. Transition temperature

Determination of K_T of salt hydrate, molar mass of solute, mass of salt hydrate and composition of given solution (Solvent- $Na_2S_2O_3.5H_2O/CH_3COONa.3H_2O$, Solutes- glucose, sucrose, urea)

7. Thermochemistry

Determination of the concentration of given strong acid/alkali.

Thermometric titration of NaOH Vs standard HCl.

Heat of displacement of Cu^{2+} by Zn.

Determination of the heat of ionisation of acetic acid.

SEMESTER II

CA 221 INORGANIC CHEMISTRY –II

Total 90 h

Unit I Sulphur, nitrogen, phosphorus and boron compounds 18 h

Sulphur-nitrogen compounds: Tetrasulphur tetranitride, disulphur dinitride and polythiazyl S_xN_y compounds. S-N cations and anions. Other S-N compounds. Sulphur-posphorous compounds:

Molecular sulphides such as P_4S_3 , P_4S_7 , P_4S_9 and P_4S_{10} . Phophorous-nitrogen compounds: Phosphazines. Cylco and linear phosphazines. Other P-N compounds

Boron-nitrogen compounds: Borazine, substituted borazines and boron nitride. Boron hydrides: Reactions of diborane. Structure and bonding. Polyhedral boranes: Preparation, properties, structure and bonding. The topological approach to boron hydride structure. *Sytx* numbers. Importance of icosahedral framework of boron atoms in boron chemistry. Closo, nido and arachno structures. Structural study by NMR. Wade's rules. Carboranes. Metallocarboranes. Organoboron compounds and hydroboration.

Unit II Coordination chemistry-II: Spectral and magnetic properties of transition metal complexes 18 h

Electronic spectra of metal complexes- Term symbols of d^n system, Racah parameters, splitting of terms in octahedral and tetrahedral fields. Correlation diagrams for d^n and d^{10-n} ions in octahedral and tetrahedral fields (qualitative approach), *d-d* transition, selection rules for electronic transition-effect of spin orbit coupling and vibronic coupling

Interpretation of electronic spectra of complexes- Orgel diagrams, Tanabe-Sugano diagrams, Calculation of Dq , B and β (Nephelauxetic ratio) values, charge transfer spectra.

Magnetic properties of complexes-paramagnetic and diamagnetic complexes, molar susceptibility, Gouy's method for the determination of magnetic moment of complexes, spin only magnetic moment. Temperature dependence of magnetism. Temperature Independent Paramagnetism (TIP). Spin state crossover, Antiferromagnetism-inter and intra molecular interaction. Application of magnetic measurements in the determination of structure of transition metal complexes.

Unit III Crystalline state 18 h

Crystal systems and lattice types. Bravais lattices. Crystal symmetry. Introduction to point groups and space groups. Miller indices. Reciprocal lattice concept. Close packed structures: BCC, FCC and HCP . Voids. Coordination number. Crystal binding: Molecular, covalent, metallic and hydrogen bonded crystals. X- Ray diffraction by crystals: Function of crystals. Transmission grating and reflection grating. Braggs equation. Diffraction methods: Powder, rotating crystal, oscillation and Weisenberg methods. Indexing and determination of lattice type and unit cell dimensions of cubic crystals.

Crystal defects: Perfect and imperfect crystals. Point, line and plane defects. Thermodynamics of Schottky and Frenkel defects. Colour centers in alkali halide crystals. Defect clusters. Extended defects: Crystallographic shear structure and stacking faults. Dislocations and crystal structure. Structure of compounds of AX (Zinc blende, Wurtzite) , AX_2 (Rutile, fluorite, antifluorite), A_mX_2 (Nickel arsenide), ABX_3 (Perosvskite, Ilmenite). Spinels. Inverse spinel structures.

Unit IV Lanthanides and actinides 18 h

Lanthanides: Characteristic properties. Electronic configurations and term symbols. Occurrence and extraction. Separation techniques. Oxidation states. Spectral and magnetic properties. Shapes of f orbital and their splitting in cubic ligand field. Actinides: Occurrence and general properties. Extraction of thorium and uranium. Electronic configuration and term symbol. Oxidation states. Spectral and magnetic properties. Comparative properties of lanthanides and actinides. Trans-uranium elements and their stabilities. Applications of lanthanide and actinide compounds. Comprehensive study of the beach sands of Kerala and their important components such as monazite, ilmenite, zircon and silminite.

Unit V Solid state chemistry 18 h

Electronic structure of solids. Free electron theory, band theory. Refinements to simple band theory, k space and Brillouin zones. Conductors, insulators and semiconductors. Band structure of conductors, insulators and semiconductors and their applications. Colour in inorganic solids.

Intrinsic and extrinsic semiconductors, doping of semiconductors and conduction mechanism, the band gap, temperature dependence of conductivity, carrier density and carrier mobility in semiconductors, synthesis and purification of semiconducting materials, single crystal growth, zone refining, fractional crystallization, semiconductor devices, rectifier transistors, optical devices, photoconductors, photovoltaic cells, solar batteries.

CA 222 ORGANIC CHEMISTRY- 11

Total 90 h

Unit I Molecular rearrangement and transformation reactions 18h

Types of organic rearrangements. Anionic, cationotropic, prototropic, free radical, carbene, nitrene and long-range rearrangements. Mechanism with evidence of Wagner-Meerwein, Pinacol, Demjanov, Hofmann, Curtius, Schmidt, Lossen, Beckmann, Wolf, Fries,

Arylazo, Fischer-Hepp, Hofmann-Martius, Von-Richter, Orton, Bamberger, Smiles, Dienone-phenol, Benzilic acid, Benzidine, Favorskii, Stevens, Wittig, Sommelet-Hauser, Bayer-Villiger, Hydroperoxide and borane rearrangements.

Unit II Aromaticity and symmetry controlled reactions 18 h

Aromaticity and antiaromaticity. Homo, hetero and non benzenoid aromatic systems. Aromaticity of annulenes, mesoionic compounds, metallocenes, cyclic carbocations, carbanions and fullerenes. Symmetry properties of MOs. Classification of pericyclic reactions. Mechanism and stereochemistry of electrocyclic, cycloaddition and sigmatropic reactions. Woodward- Hoffmann rules. FO, CD and Huckel-Mobius analysis of electrocyclic and cycloaddition reactions including biological cyclo additions. FO analysis of [I, j] and [3, 3] migrations. 1, 3- dipolar cycloaddition. Stereo aspects of Diels- Alder reaction and Cope re arrangement. Fluxinol molecules. Retro Diels- Alder, ene, cheletropic and cis elimination reactions and synthetic applications.

Unit III Organic photochemistry 18 h

Photochemical processes**.** Energy transfer, sensitization and quenching. Singlet and triplet states and their reactivity. Photoreactions of carbonyl compounds, enes, dienes and arenes. Norrish reactions of acyclic ketones. Free radical reactions. Patterno-Buchi, Barton, photo-Fries and Di-л methane rearrangements. Photoreactions of Vitamin D. Photosynthesis and photochemistry of vision. Singlet oxygen generation and their reactions. Applications of photochemistry.

Unit IV Chemistry of natural products and biomolecules 18 h

Introduction to primary and secondary metabolites in plants. Extraction methods of chemical constituents from plants, such as fractionation using solvents, specific extraction of alkaloids and supercritical fluid extraction. Characterizations of isolated compounds (terpenes, sterols, alkaloids, carbohydrates, flavonoids and poly phenols) by colour reactions and spray reagents. Biosynthesis of terpenes from mevalonic acid and sterols from squalene. Structure elucidation of ocimene monoterpene, classification of pigments, structure elucidation of β –carotene. Structural differences between a triterpene and a sterol. Synthesis of quercetin, synthesis of testosterone, androsterone, estrone and progesterone. Determination of carbon skeleton of alkaloids (Hofmann, Emde and Von Braun degradation methods). Structural elucidation of ephedrine, nicotine , atropine,hygrine.

Unit V Physical organic chemistry 18 h

Reactivity in relation to molecular structure and conformation. Steric effects. F strain. Ortho effect. Bond angle strain. The Hammett equation and its applications. Taft equation. Linear free energy relationships. Solvent polarity and parameters. Y, Z and E parameters and their applications. Primary and secondary kinetic isotope effects. Salt effects and special salt effects in SN reactions. Kinetic and thermodynamic control of reactions. The Hammond postulate. Principle of microscopic reversibility. Marcus theory. Methods of determining reaction mechanisms. Phase transfer catalysis and its applications.

CA 223 PHYSICAL CHEMISTRY -II

Total 90 h

Unit I Chemical Bonding 18 h

Approximate methods: Variation method- Variation theorem and its proof. Linear variation functions. Secular equations and secular determinants.

Perturbation method-Successive correction to an unperturbed problem. Detailed treatment of first order non-degenerate case only. LCAO-MO Theory- MO theory of H_2^+ and H_2. MO treatment of other homo diatomic molecules Li_2, Be_2, B_2, C_2, N_2, O_2 and F_2. MO treatment of hetero diatomic molecules LiH, CO, NO and HF. Spectroscopic term symbols for homo diatomic molecules.

Valance bond theory of H_2. Quantum mechanical treatment of SP, SP^2 and SP^3 Hybridisation.

HMO theory of conjugated π-systems. Bond order and charge density calculations. Free valance. Application of HMO method to ethylene, allyl system, butadiene and benzene.

Secondary bond forces: ion dipole, dipole-dipole, ion-induced dipole, London dispersion forces.

Unit II Spectroscopy –I 18 h

Microwave spectroscopy: Rotational spectrum, Intensity of spectral lines, calculation of inter nuclear distance. Non-rigid rotors and centrifugal distortion. Rotational spectra of polyatomic molecules-linear and symmetric top molecules. Introduction to instrumentation.

Vibrational Spectroscopy: Vibrational spectra of harmonic and anharmonic oscillator. Selection rules. Morse curve, fundamentals and overtones. Determination of force constant. Rotational fine structure, P,Q,R branches of spectra.

Vibrational spectra of polyatomic molecules: Normal modes, classification of vibrational modes into stretching (asymmetric, symmetric), bending, parallel and perpendicular

vibrations. Finger print region and group frequencies. Introduction to FTIR and instrumentation.

Raman spectroscopy: Raman scattering, polarisability and classical theory of Raman spectrum. Rotational and vibrational Raman spectrum. Raman spectra of polyatomic molecules. Complementarity of IR and Raman spectra. Mutual exclusion principle. Introduction to instrumentation. Laser Raman spectrum.

Electronic spectra. Electronic spectra of diatomic molecules. Vibrational coarse structure and rotational fine structure of electronic spectrum. Franck-Condon principle. Types of electronic transitions. Fotrat diagram. Predissociation . Calculation of heat of dissociation.

Electronic spectra of polyatomic molecules: Electronic transition among molecular orbitals and absorption frequencies. Effect of conjugation. Introduction to instrumentation. Simultaneous determination of two components.

Unit III Applications of thermodynamics 18 h

Phase equillibria: Criteria of Equillibrium. Derivation of phase rule Discussion of two component systems forming solid solutions with and without maximum or minimum in freezing point curve. Systems with partially miscible solid phases.

Three component systems : Graphical representation. Three component liquid systems with one pair of partially miscible liquids. Influence of temperature. Systems with two pairs and three pairs of partially miscible liquids. Two salts and water systems. Isothermal evaporation. Transition point and double salt formation.

Thermodynamics of irreversible processes : Simple examples of irreversible processes. General theory of non equilibrium processes. Entropy production from heat flow. Matter flow and current flow. Generalised equation for entropy production. The phenomenological relations. Onsager reciprocal relation, Application of irreversible thermodynamics to diffusion. Thermal diffusion, Thermo osmosis and thermomolecular pressure difference., electro kinetic effects, the Glansdorf- Pregogin equation. Far from equilibrium region. Principle of minimum entropy production. Thermodynamic analysis of stability. Stability criterion and Le-Chatelier Brawn Principle.

Unit IV Statistical mechanics –I 18 h

Mechanical description of molecular systems. Thermodynamic probability and entropy. Microstates. Concept of ensembles Canonical and Grand canonical ensemble. Maxwell Boltzmann distribution.

Quantum statistics: Bose Einstein Statistics , Bose Einstein distribution. Thermodynamic probability, Bose Einstein distribution function. Examples of particles. Theory of Para magnetism. Bose Einstein condensation, Liquid Helium. Supercooled liquid. Fermi- Dirac Statistics. Fermi- Dirac Distribution, Examples of particles Fermi Dirac Distribution function Thermionic emission. Relation between Maxwell Boltzmann, Bose Einstein and Fermi - Dirac Statistics

The Partition functions. Partition function for free linear motion, for free motion in a shared space, for linear harmonic vibration.

Unit V Electrochemistry 18 h

Ionics- Ions in solution. Deviation from ideal behaviour. Ionic activity. Ion-solvent interaction. Born equation. Ion-ion interaction. Activity coefficient and its determination. Debye-Huckel limiting law. Equation for appreciable concentration. Osmotic coefficient. Activities in concentrated solutions. Ion associations. Strong electrolytes. Ion transport. Debye-Huckel treatment. Onsager equation. Limitation of the model. Conductance at high frequencies and high potentials.

Electrodics: Different type of electrodes. Electrochemical cells. Concentration cells and activity coefficient determination. Origin of electrode potential. Liquid junction potential. Evaluation of thermodynamic properties. The electrode double layer. Electrode-electrode interface. Theory of multilayer capacity. Electrocapillarity. Lippmann potential and membrane potential.

Fuel cells- H_2-O_2 fuel cell, fuel cell for high temperature applications.

Electrokinetic phenomena. Mechanism of charge transfer at electrode- electrolyte interface. Electrolysis. Current- potential curve. Dissolution, deposition and decomposition potentials. Energy barriers at metal –electrolyte interface. Different types of overpotentials. Butler-Volmer equation. Tafel and Nernst equation. Rate determining step in electrode kinetics. The hydrogen and oxygen over voltage. Theories of overvoltage.

SEMESTER III

CA 231 INORGANIC CHEMISTRY- III

Total 90 h

Unit I Organometallic compounds 18 h

Nomenclature of organometallic compounds.Types of metal complexes. Metal carbonyls, bonding in metal carbonyls. Application of infrared spectroscopy for the elucidation of metal carbonyl bonding. Bonding in metal nitrosyls and cyanides. Synthesis, structure and bonding in polynuclear carbonyls with and without bridging. Complexes with linear π- donor ligands: Olefins, acetylenes, dienes and allyl complexes. Hapto nomenclature. Complexes with cyclic π donors: Cyclopentadiene, benzene, cycloheptatriene and cyclooctatetraene complexes, structure and bonding. Fluxional molecules. Catalysis by organometallic compounds: Hydrogenation, hydroformylation and polymerization reactions.

Unit II Coordination chemistry-III: Reactions of metal complexes 18 h

Energy profile of a reaction - Thermodynamic and kinetic stability, Classification of ligand substitution reactions -kinetics and mechanism of ligand substitution reactions in square planar complexes, trans effect- theory and synthetic applications.

Kinetics and mechanism of octahedral substitution- water exchange, dissociative and associative mechanisms, base hydrolysis, racemization reactions, solvolytic reactions (acidic and basic)

Electron transfer reactions: Outer sphere mechanism- Marcus theory, inner sphere mechanism- Taube mechanism. Photochemical reactions- substitution and redox reactions of Cr(III) , Ru(II) , and Ru(III) complexes. Photo-isomerisation and photo-aquation reactions of metal complexes.

Unit III Bioinorganic chemistry 18 h

Essential and trace elements in biological systems, structure and functions of biological membranes, mechanism of ion transport across membranes, sodium-potassium

pump. Photosynthesis, porphyrin ring system, chlorophyll, PS I and PS II. Synthetic model for photosynthesis. Role of calcium in biological systems.

Oxygen carriers and oxygen transport proteins- haemoglobin, myoglobin and haemocyanin. Iron storage and transport in biological systems- ferritin and transferrin. Redox metalloenzymes-cytochromes, peroxidases and superoxide dismutase and catalases. Nonredox metalloenzymes- CarboxypeptidaseA- structure and functions. Nitroeenaesesgeases, biological nitrogen fixation. Vitamin B_{12} and coenzymes.

Unit IV Electrical and magnetic properties of solids 18 h

Conductivity of pure metals. Superconductivity. Photoconductivity. Photovoltaic effect, Dielectric properties. Dielectric materials. Ferroelectricity, pyroelectricity, piezoelectricity and ionic conductivity. Applications of ferro, piezo and pyroelectrics.

Magnetic properties of solids: Behaviour of substances in a magnetic field. Diamagnetism, paramagnetism, ferromagnetism, antiferromagnetism and ferrimagnetism. Effect of temperature, Curie and Curie- Weiss laws. Magnetism of ferro and antiferromagnetic ordering. Super exchange. Lasers and their applications.

Unit V Nuclear chemistry 18 h

Nuclear structure, mass and charge. Nuclear moments. Binding energy. Semiempirical mass equation. Stability rules. Magic numbers. Nuclear models: Shell, Liquid drop, Fermi gas, collective and optical models. Equation of radioactive decay and growth. Half life and average life. Radioactive equilibrium. Transient and secular equilibria. Nuclear reactions. Introduction, production of projectiles, nuclear reaction cross section, nuclear dynamics, threshold energy of nuclear reaction, Coulomb scattering, potential barrier, potential well, formation of a compound nucleus. Nuclear reactions: Direct nuclear reactions, heavy ion induced nuclear reactions, photonuclear reactions.

Neutron capture cross section and critical size. Nuclear fission as a source of energy, Nuclear chain reacting systems. Principle of working of the reactors of nuclear power plants. Breeder reactor. Nuclear fusion reaction, stellar energy. Detection and measurement of radiation.

CA 232 ORGANIC CHEMISTRY-111

Total 90 h

Unit1 UV-VIS, IR and Mass spectroscopy 18 h

Electronic transitions and analysis of UV spectra of enes, enones and arenes. Woodward-Fieser rules. Effect of solvent polarity on UV absorption. Principle of characteristic group frequency in IR. Identification of functional groups and other structural features by IR, Hydrogen bonding and IR bands. Sampling techniques. FTIR and its instrumentation. Organic mass spectroscopy. EI, CI, FAB, Electrospray and MALDI ion sources. Magnetic, High resolution (Double focusing), TOF and quadruple mass analysers. Characteristic EIMS fragmentation modes and MS rearrangements. Mass spectral fragmentation patterns of long chain alkanes, alkenes, alkynes, carbonyl , nitro, amino and carboxy compounds. Strategies for the analysis of mass spectra..

Unit II NMR spectroscopy and sstructure elucidation 18 h

Theory of NMR spectroscopy, chemical shifts, anisotropic effects and coupling constant. Spin-spin interactions in typical systems. First order and second order spectra. Simplification methods of complex spectra by high field NMR, shift reagents, chemical exchange and doule resonance. Theories of FT NMR (1D NMR), 2D NMR and ^{13}C NMR spectroscopies. ^{13}C NMR chemical shifts. Instrumentation of NMR. Applications of NOE, APT, DEPT, INEPT and 2-DNMR and INADEQUATE, HOHA spectroscopies. Introduction to 3D NMR. Spectral interpretations and structure identification. Spectral interpretation using actual spectra taken from standard texts. Solving of structural problems on the basis of numerical and spectrum based data.

Unit III Molecular recognition and supramolecular chemistry 18 h

Introduction to supramolecular chemistry. One-pot reactions.The concepts of molecular recognition, host, guest and receptor systems. Forces involved in molecular recognition. Hydrogen bonding, ionic bonding, π-stacking, Vander Walls and hydrophobic interactions. Introduction to molecular receptors. Tweezers, cryptands and carcerands. Cycophanes, cyclodextrins and calixarenes- typical examples. Non-covalent interactions in biopolymer structure organization. Role of self organization and self association in living nature. Importance of molecular recognition in DNA and protein structure, their function and protein

biosynthesis. Supramolecular systems like Organic zeolite, Clathrate hydrates of gases, Helicates. Nanotubes, liquid crystals, nanotechnology and other industrial applications of supramolecular chemistry.

Unit IV Medicinal chemistry 18 h

Retrosynthetic analysis and disconnection approach. Synthetic strategy and synthons **,**

Combinatorial organic synthesis, introduction, methodology, automation, solid supported and solution phase synthesis, study of targeted or focused libraries and small molecule libraries, Applicaion- drug discovery.

Drug design and development-Discovery of a drug, a lead compound. Development of drug-Pharmaccophore identification, modification of structure, structure-activity relationship, structure modification to increase potency. The Hammet equation, Taft equation and lipophilicity. Computer assisted drug design. Receptors and drug action. Natural products and drug development. Different classes of drugs with examples. Synthesis of paracetamol, phenobarbital, diazepam, sulphamethoxazole, benzyl penicillin, chloramphenicol.

Unit V Green chemistry 18 h

Twelve principles of green chemistry. Green chemical strategies for sustainable development- Reaction mass balance, atom economy evaluation for chemical reaction efficiency, green solvents, reaction media- Synthesis under water, solventless, fluorous and ionic liquid media. Synthesis using scavenger resins, catalysis and biocatalysis. Green computation. Green processes-. Microwave synthesis- fundamentals of microwave synthesis-Two Principal Mechanisms for Interaction With Matter- The Microwave Effect with examples - Single-Mode and Multimode Microwave cavities. Microwave technology-Techniques and applications in MORE chemistry. Sonochemical synthesis. Applications of sonication in the synthests of organic compounds.

CA 233 Physical Chemistry -III

Total 90 h

Unit I Computational chemistry. 18 h

Introduction to computational chemistry, concept of potential energy surface(PES), stationary point, saddle point and geometry optimisation.

Basis sets, STO, Gaussian functions and its properties, GTO, contracted Gaussians, minimal , split valance, polarised and diffused basis sets.

Introduction to SCF. Wave function for open shell state, RHF, ROHF and URHF. Model Chemistry. Brief description of computational methods- ab-initio, semiempirical and density functional and molecular mechanics methods. Construction of Z-matrix for simple molecules- H_2O, H_2O_2, H_2CO, CH_3CHO, NH_3, and CO_2.

Unit II Spectroscopy II 18 h

Resonance spectroscopy: Nuclear Magnetic resonance Spectroscopy, Nuclear spin. Interaction between nuclear spin and applied magnetic field. Proton NMR . Population of energy levels. Nuclear resonance. Chemical shift. Relaxation methods. Spin-spin coupling. Fine structure. Elementary idea of 2D and 3D NMR. Introduction to instrumentation.

ESR spectroscopy: Electron spin. Interaction with magnetic field. Kramer's rule. The g factor. Determination of g values. Fine structure and hyperfine structure. Elementary idea of ENDOR and ELDOR.

Mossbauer spectroscopy: Basic principles. Doppler effect, chemical shift, recording of spectrum, application. Quadrupole effect. Principle and application of NQR spectroscopy.

Photoelectron spectroscopy. Introduction to UV photoelectron and X-ray photoelectron spectroscopy.

Unit III Statistical mechanics II 18 h

Complex partition functions and partition function for particles in different force fields. Langevin's partition function and its use for the determination of dipole moment. Electrostatic energies. Molecular partition functions. Translational, vibrational, rotational and electronic partition functions. Total partition functions , partition functions and

thermodynamic properties. The principle of equipartition of energy. Chemical equilibrium. Law of mass action. Transformation of the equilibrium expressions. Statistical derivation.

Real gases, intermolecular potential and virial coefficients. Equipartition principle and Quantum theory of heat capacity. Calculation of heat capacity of gases, limitation of the method. Heat capacity of solids. Dulong and Petit's law, Kopp's law, Classical theory and its limitation. The vibrational properties of solids. Einstein theory of heat capacity. The spectrum of normal modes. Limitations of Einstein's theory. The Debye theory, the electronic specific heat. Structure and thermal properties of liquids. Pair correlation functions.

Unit IV Surface chemistry and catalysis 18 h

Different types of surfaces. Properties of surface phase. Thermodynamics of surface. Surface tension of solutions. Gibb's adsorption equation and its verification. Surfactants and miscelles Examination of surfaces using low energy electron diffraction, photoelectron spectroscopy, ESCA, scanning probe microscopy, Auger electron spectroscopy , SEM and TEM.

Surface films: different types, Surface pressure and Surface potential, and their measurements and interpretation.

The Gas- solid inter phase. Types of adsorption. Heat of adsorption, The Langmuir theory- kinetic and statistical derivation. Multilayer adsorption- the BET theory and Harkins- Jura theory. Adsorption from solutions on solids. Langmuir and classical isotherms. Chemisorption-. differences with physical adsorption. Adsorption isotherms, adsorption with dissociation. Adsorption with interaction between adsorbate molecules.

Measurement of surface area of solids: Harkins – Jura absolute method, entropy method and the point B method. Use of Langmuir, BET and Harkins – Jura isotherms for surface area determination.

Catalysis: Mechanism and theories of homogeneous and heterogeneous catalysis. Enzyme catalysis, Bimolecular surface reactions. Langmuir – Hinshelwood mechanism

Instrumental methods of catalyst characterization- diffraction and thermal methods, spectroscopic and microscopic techniques.

Unit V Electro Analytical and spectrophotometric methods. 18 h

Potentiometric methods: Reference electrodes and indicator electrodes. The hydrogen, calomel, Ag-AgCl electrode. The glass electrode- its structure, performance and limitations. Measurement of pH. Potentiometric titrations- redox and precipitation titrations. Electrogravimetry: Principle and method. Determination of Copper. Separation of metals. Conductometry: principle and method. Conductometric titrations. Coulometry: Principle and method. Coulometric titrations. principle and method of polarography, Voltametry, cyclicvoltammetry, stripping voltammetry and amperometry.

Flame emission and atomic absorption spectrometry. Instrumentation for AAS. The flame characteristics. Atomiser used in spectroscopy. Hollow cathode lamp. Interference in AAS. Application of AAS.

CA 234 Inorganic Chemistry Practicals -II Total-125 h

1. Estimation of simple mixture of ions (involving quantitative separation) by volumetric and

   Gravimetric methods.

2. Analysis of typical alloys and ores

3. Ion exchange separation of binary mixtures.

4. Spectral Interpretation of metal complexes using IR, UV-Vis. spectral data. Supplementary information like metal estimation, CHN analysis, conductivity measurements and magnetic measurements to be provided to the students. Assessment is based on arriving at the structure of the complex and assignment of IR spectral bands.

5. Interpretation of TG and DTA curves of metal oxalates/acetates/sulphates/chlorides in hydrated forms. Assessment is based on the identification of various stages.

CA 235 ORGANIC PRACTICALS-II

Total 125 h

A.**Volumetric estimation** of

1) Aniline 2) Phenol 3) glucose

4) Iodine value and saponification value of coconut oil

B). **Colorimetric estimation** of 1) Aniline 2) Glucose 3) Cholesterol 4) Ascorbic acid 5) Streptomycin or Aspirin.

C). Spectral identification (UV, IR, ^{1}H NMR, ^{13}C NMR, EI mass) of Organic compounds from a library of organic compounds

D. Separations of mixtures by Paper Chromatography

1) Separation of amino acids 2) Separation of dyes

E) Three stage preparation

1)Benzaldehyd**e** ⟶ Benzoin(green synthesis with thiamine HCl) ⟶ benzil

→ benzilic acid

2) Phthalic acid → Phthalic anhydride → pthalimide → anthranilic acid

CA 236 PHYSICAL PRACTICALS –II **Total 125 h**

1. Conductometry

Determination of strength of strong and weak acids in a mixture

Determination of strength of a weak acid.

Determination of solubility product of a sparingly soluble salt ($PbSO_4$, $BaSO_4$ etc.)

Hydrolysis of NH_4Cl or CH_3COONa or aniline hydrochloride

Determination of order of reaction, rate constant and energy of activation for saponification of ethyl acetate

Precipitation titrations.

Determination of critical micellar concentration (CMC) of sodium lauryl sulphate from measurement of conductivities at different concentrations.

Equivalent conductance at infinite dilutions and verification of Kohlraush's Law.
Determination of Onsager constants.

2. Potentiometry

Determination of emf of Daniel cell.
Determination of the emf of various $ZnSO_4$ solutions and hence the concentration of unknown $ZnSO_4$ solution.
Determination of valency of mercurous ion.
Determination of temperature dependence of EMF of a cell
Determination of stoichiometry and formation constant of silver-ammonia complex.
Determination of activity and activity constant of electrolytes.
Determination of thermodynamic constants of reactions.
pH metric titrations.
Acid alkali titrations using Quinhydrone electrode.
Titrations(double) involving redox reactions – Fe^{2+} Vs $KMnO_4$, $K_2Cr_2O_7$, $Ce(NH_3)SO_4$ and KI Vs $KMnO_4$
Determination of strengths of halides in a mixture.
Determination of pH of buffer solutions and hence to calculate the E_0 of quinhydrone electrode

3. Spectrophotometry

Verification of Beer-Lambert's law.
Absorption spectra of conjugated dyes.
Determination of concentration of potassium dichromate and potassium permanganate in a mixture.
To study the complex formation between Fe^{3+} and salicylic acid.
Determination of pKa of an indicator.

4. Polarimetry

Measurement specific rotation of glucose.
Determination of specific rotation of sucrose
Determination of unknown concentration of glucose solution.
and rate constant of its hydrolysis in presence of HCl

5. Polarography :

Determination of half wave potential E ½ and unknown concentration of Cd^{2+} ion.

Determination of concentrations of metal ions in a mixture.

6. Surface tension

Determination of surface tension of various liquids by Stalagmometric method (drop number / drop weight)

Determination of parchors of molecules and various groups.

Determination of concentration of a mixture.

Determination of surface tension and parachor of liquids using double capillary method.

7. Refractometry

Determination of molar refraction of pure liquids

Determination of concentration of KCl solution/glycerol solution

Determination of solubility of KCl in water.

Determination of molar refraction of solid KCl

Study the stoichiometry of potassium iodide-mercuric iodide complex.

Determination of concentration of KI solution.

8. Viscosity

Determination of viscosity of various liquids using Ostwald,s viscometer.

Determination of unknown composition of given liquid mixture like toluene-nitrobenzene.

Verification of Kendall's relation.

Verification of Jon Dole's equation.

SEMESTER IV

CA 241 APPLIED CHEMISTRY

Total 90 h

UNIT I Water treatment

Standards for drinking water, Methods of Treatment of water for domestic and industrial purposes: Sedimentation, Coagulation, Filtration, Sterilization, Break point chlorination. Determination of alkalinity of water, Hardness of water: Units, determination. Demineralization of water.

Softening of water: Lime-soda Process, Ion exchange process, Zeolite process.

Boiler Troubles: Carry Over, Priming, Foaming, Scale, Sludge, Corrosion, Caustic Embrittlement.

Internal treatment of water: Carbonate conditioning, Phosphate conditioning, Colloidal conditioning, Calgon conditioning.

Removal of organics and harmful inorganics from water and wastewater. Biological treatment of waste water: theory and practice. Sludge treatment and disposal.

UNIT II Petroleum, fuels & combustion, lubricants

Petroleum**:** Petroleum, cracking, Synthetic petrol, Refining of gasoline, Reforming, Chemical structure of fuel and knocking. Octane Rating of fuels, Cetane Rating, Diesel engine fuel, Kerosene, LPG as a fuel.

Fuels & Combustion**:** Classification, Calorific value, Types, Determination by Bomb calorimeter, Dulong's Formula, Analysis of Coal, Proximate and Ultimate analysis, Fuel gas analysis, Significance, Numericals, Carbonization of Coal, Manufacture of metallurgical coke by Otto Hoffman's byproduct oven, Combustion calculations.

Lubricants: Functions of' lubricant, Mechanism of lubrication, Fluid or Hydrodynamic Lubrication, Thin film or Boundary lubrication & Extreme pressure lubrication. Lubricants for Extreme ambient conditions and for special applications. Properties of lubricants and tests.

UNIT III Corrosion and protective coatings

Corrosion and its control**:** Nernst Theory, Standard Electrode Potential, Galvanic Series, Concentration cell, Types of corrosion: Uniform and Galvanic, Erosion, Crevice, Pitting, Exfoliation and Selective leaching, Inter-angular Stress, Waterline, Soil, Microbiological. Theories of corrosion: Acid, Direct Chemical attack, Electrochemical, Corrosion reactions, Factors affecting corrosion, Protective measures against corrosion, Sacrificial anode, Impressed current cathode protection.

Protective coatings**:** Paints: Constituents, functions & mechanism of drying. Varnishes and Lacquers; surface preparation for metallic coatings, electroplating (gold) and electrodeless plating (Nickel), anodizing, phosphate coating, powder coating & antifouling coating.

UNIT IV Applied inorganic chemistry 18 h

Introduction to chemical industry: Flow sheet preparation. Principles of process selection and operation selection. Basic raw materials and routes to major inorganic products. Flow sheets and engineering aspects of the manufacture of sulfuric acid, ammonia, urea, glass.

Portland cement**:** Manufacture of cement, Dry and Wet process, Flow sheet and engineering aspect of the manufacture of Portland cement, Important process parameters for manufacturing a good cement clinker. Characteristics of the constitutional compounds of cement.

Additives for cement, Properties, General composition, Testing of cement, Chemical & physical requirement.

Refractories: Definition, Classification with Examples; Criteria of a Good Refractory Material; Causes for the failure of a Refractory Material. Flow sheet and engineering aspect of the manufacture of Refractories.

UNIT V Applied organic chemistry

Raw materials and routes to major organic products. Flow sheets and engineering aspects of the manufacture of important products such as nitrobenzene, vinyl chloride, soaps, detergents and hydrogenation of oils.

Pharmaceuticals: manufacturing process of aspirin, vitamin A and paracetamol.

Pesticides: manufacture of BHC, DDT, Carbaryl and Malathion. Manufacture of dyes.

Cosmetics: Talcum Powder, Tooth pastes, Shampoos, Nail Polish, Perfumes, soaps, and detergents - General formulations and preparation - possible hazards of cosmetics use. Adulterants: Adulterants in milk, ghee, oil, coffee powder, tea, asafoetida, chilli powder, pulses and turmeric powder - identification. Colour chemicals used in food-soft drinks and its health hazards

Polymers: Types of Polymerization. Thermoplastics & thermosetting polymers. Preparation, properties and applications of the Polyethylene, Teflon, PVC, Nylon, Phenol formaldehyde & Urea Formaldehyde. Silicone resins, silicone fluids, silicone greases. Polyurethanes, foamed or cellular plastics. Elastomers: Natural rubber, Vulcanization of rubber & Synthetic rubber.

CA 242 DISSERTATION

Each of the students has to carry out original research in a topic in accordance with the Elective paper chosen for Semester IV under the guidance and supervision of a teacher in the concerned Department of the College.

Instructions to Question Papers Setters

The Syllabus of each theory has five units. While setting the question papers, equal weight is to be given to each of the Units for choosing the questions. Each question paper is of 3 hours duration and has three Sections, namely Section A, Section B and Section C constituting a total **75** marks as detailed.

Section A- Five questions, one from each Unit containing three short answer questions marked (a), (b), and (c), each of which has **2** marks. One has to answer any two of (a), (b) or (c) from each of the five questions. (2x10 = 20 marks)

Section B- Five questions, one from each Unit containing two short essay questions marked (a) and (b), each of which has **5** marks. One has to answer either (a) or (b) from each of the five questions. (5x5 = 25 marks)

Section C- Five essay questions, one from each unit having **10** marks. One has to answer any three questions from the five questions asked.(10x3 = 30 marks)
